SYMBOLS USED IN THIS REPORT

- Quantity is zero in frequency table
- Data not available
- ... Rate or per cent not applicable
- 0.0 Rate or per cent more than zero but less than 0.05
- 0 Quantity is zero in rate table

INTRODUCTION

This is the tenth consecutive year this report has been prepared. The format has varied from year to year as efforts are made to present the material in the most useful and concise manner. In 1953, a format which should prove useful over a period of years was introduced and is followed very closely in this report.

Most data for a county or city are together in one table. Counties are in alphabetical sequence and cities are in alphabetical sequence within population size groups. No data are shown for health regions. However, certain data are tabulated by regions and are available on request. Detailed state data are included for the current year as well as several historical series for 1926-1957.

Most tabulations are based on births, deaths, fetal deaths, marriages and divorces recorded in the Division of Vital Records and known births and deaths of Georgia residents which occurred outside of Georgia. Unless specifically stated otherwise, all data on births, deaths and fetal deaths are allocated to place of residence. Marriages are tabulated by place of issuance of licenses and divorces by place in which divorce is granted.

Population estimates and number of physicians by county are also included in this report.

Additional copies of most of the tables and more detailed tabulations of these and other health statistics are available. Address correspondence to:

Atlanta 3, Georgia

SOME FACTORS INFLUENCING VITAL STATISTICS

Sources of data

The data contained in this report are obtained primarily from certificates of birth, death, fetal deaths, reports of divorces and annulments and the marriage registry. Population estimates are compiled in the Division of Statistics using births, deaths, and school enrollment figures as a measure of increase or decrease and the latest census count as a base. (Copies of these estimates with a description of method used are available upon request.)

Completeness of registration

In connection with the Census of Population Reports of 1940 and 1950, tests were made to determine the completeness of birth registration in each state. The 1950 test showed 94.6% of Georgia's births to be registered. The percentage of completeness varies from county to county and in some instances accounts for differences in rates which can result in misinterpretations of health statistics.

Estimates of completeness of birth registration for 1940-1957 are shown in Table 1. Estimates for 1941-1949 are interpolations of the results obtained in the birth registration tests of 1940 and 1950. Percentage completeness of registration by race and place of delivery in 1950 was applied to reported births to obtain estimates for 1951-1957. The estimated increase since 1950 is due entirely to the increase in the proportion of births delivered in hospitals.

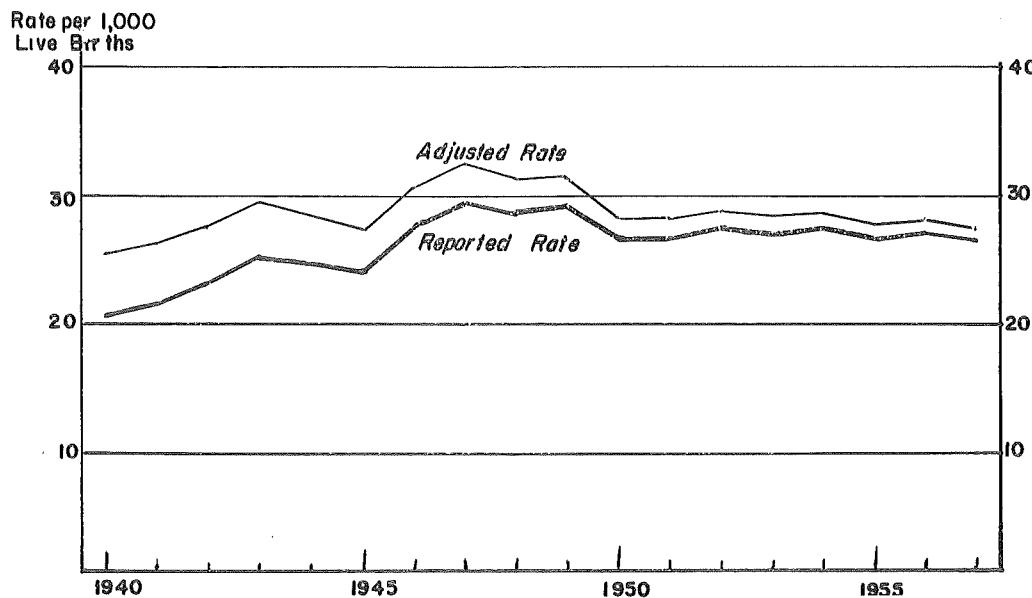

TABLE 1 - ESTIMATES OF BIRTH REGISTRATION COMPLETENESS, BY PLACE OF OCCURRENCE, GEORGIA, 1940-1957

Year	Per Cent Completeness
1940	81.3*
1941	82.6
1942	84.0
1943	85.3
1944	86.6
1945	88.0
1946	89.3
1947	90.6
1948	91.9
1949	93.3
1950	94.6*
1951	95.1
1952	95.5

1955	96.2
1956	96.3
1957	96.4

* Results of birth registration completeness tests

Figure 1 shows live birth rates before and after correction for under-registration.

Figure 1
LIVE BIRTH RATES ADJUSTED FOR
UNDERREGISTRATION, GEORGIA, 1940-1957

Very little study has been made on completeness of registration of other vital events. However, the statistics on these events do show certain indications concerning the quality of reporting.

It is felt that death registration, in general, is more complete than birth registration since it is necessary to file a death certificate in order to receive a burial permit. Completeness of death registration is probably poorest for infants who die soon after birth.

Fetal deaths are probably grossly underreported in Georgia. An increasing amount of attention is being focused on the relationship of late fetal and early infant deaths, and adequate analysis requires good reporting.

County ordinaries are required to report marriages to the Division of Vital Records and completeness of reporting is believed to be good.

Accuracy and completeness of reporting items on certificates

The accuracy and completeness of the reporting of events determine to a great extent the quality of statistics regarding such events.

Unanswered items on certificates result in "unknown" quantities which can not be interpreted in the analysis of the data, and erroneously answered items create a bias in the data which will affect any conclusions made.

One of the most serious problems in birth and death registration is the allocation of data to urban or rural residence. When a residence is outside the corporate limits of a city and the city is shown as the address, the residence is classified as urban unless the person completing the certificate indicates that

the residence is outside the city. This results in an over-allocation of events to urban areas with an under-allocation to rural areas. This should be considered in analyzing rural and urban differences.

Changes in classification of causes of death

A major change in classifying causes of death was made in 1950 with the adoption of the sixth revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.

In order to compare specific death rates since 1949 with those in 1949 or prior years, it was necessary to determine comparability ratios for each disease to use in adjusting the rates for 1940-1949. The comparability ratio is the ratio of the number of deaths assigned to a cause under the "Sixth" revision to the number assigned to the same cause under the "Fifth" revision. Ratios for some of the leading causes are given in Vital Statistics, Georgia, 1953, Tables 4 and 12, pages xiii and xxv.

Changes in the manner of medical certification have also resulted in improved mortality statistics. One indication of improvement is the decline in the per cent of deaths attributed to ill-defined and unknown causes. In 1957, only 1.1% of the total deaths was in this category as compared with 2.5% in 1948. This does not necessarily imply that the quality of the information is better, but it does show that more certificates have classifiable data on cause of death.

TABLE 2 - DEATHS DUE TO ILL-DEFINED AND UNKNOWN CAUSES,
GEORGIA, 1948-1957

<u>Year</u>	<u>Number</u>	<u>Per Cent of Total Deaths</u>
1948	740	2.5
1949	677	2.3
1950	615	2.0
1951	642	2.1
1952	581	1.9
1953	478	1.6
1954	433	1.4
1955	359	1.2
1956	315	1.0
1957	364	1.1

Socio-economic status

The socio-economic status of a population affects vital statistics in various ways.

Georgia's population is younger and includes a larger proportion of non-whites than the United States as a whole. The average number of years of school completed and per capita incomes in Georgia have been lower than United States figures for many years.

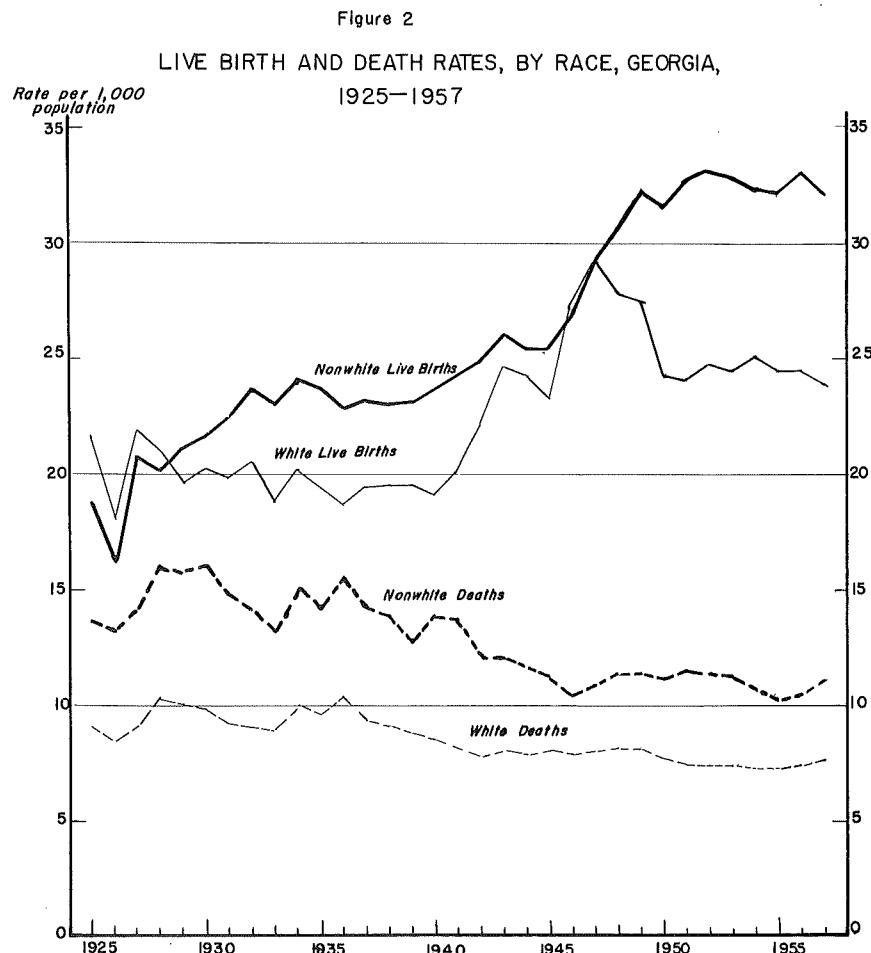

Population, race and age trends

Most of Georgia's recent growth can be attributed to gains among the white population. An indication of the high rate of increase for the white population is illustrated by U. S. Census Bureau reports which show the white proportion of the population increasing from 53.2% in 1900 to 69.1% in 1950.

A large amount of growth from 1900 to 1950 has taken place in urban areas. The urban population which represented only 15.6% of the population in 1900 had increased to 45.3% in 1950. Although this trend has prevailed among both white and nonwhite races, the rate of urbanization for whites has proceeded at a higher rate than for nonwhites.

Georgia's population is living to be older than ever before. In 1950, all age groups over 25 years of age were greater numerically and represented a higher per cent of the total population than in 1900. This general trend is true of each race-sex component of the population.

One of the factors in Georgia's population growth is natural increase (the excess of births over deaths). In 1957, Georgia had a natural increase of 68,461. Figure 2 shows live birth and death rates, by race, for Georgia, 1925-1957. The difference between the birth and death rates is the rate of natural increase.

Military events

In 1950, vital events occurring on military reservations were included in county figures. In all other years from 1940-1957, events occurring on military reservations are included in state totals but excluded from county totals. The counties affected most by this procedure are Chattahoochee, Liberty, Muscogee and Richmond.

DISCUSSION OF 1957 STATISTICS

Population

The estimated population for Georgia, July 1, 1957, shows an increase of 12.2% over the Census figures for Georgia, April 1, 1950. Approximately 84% of this increase occurred in the white population. (See Table 3)

"Urban" as used here results in an estimate which is less than would be obtained by using the United States Census Bureau's 1950 definition.

TABLE 3 - POPULATION BY RACE AND RESIDENCE, GEORGIA, APRIL 1, 1950 - JULY 1, 1957

Year	Total	White	Nonwhite	Urban		Rural	
				White	Nonwhite	White	Nonwhite
Estimate July 1, 1957	3,866,000	2,733,000	1,133,000	1,222,000*	566,000*	1,511,000	567,000
U. S. Census April 1, 1950	3,444,578	2,380,577	1,064,001	1,067,911	491,536	1,312,666	572,465
% change since April 1, 1950	12.2	14.8	6.5	14.4	15.1	15.1	- 1.0

* Urban as used here includes the population of incorporated places which had 2,500 or more in 1957 plus military personnel stationed in the state.

Source: U. S. Census figures from Census Bureau Reports

Physicians

As of December 31, 1957, there were 3,182 physicians located in Georgia. Of this number, 2,529 were engaged in private practice, 406 were institutional physicians, 55 were in public health and 192 were retired. There were 1,500 civilian persons for each physician in private practice. County totals for physicians in private practice are shown in Table XVI, page 94.

Marriages and divorces

In 1957, there were 51,235 marriages recorded in Georgia, a decrease of 986 from the 52,221 recorded in 1956. The rate in 1957 was 13.3 per 1,000 population as compared with 13.8 in 1956.

Table 4 shows marriages occurring in Georgia in 1957, by place of residence of the bride and groom. Approximately 39% of the persons married in Georgia were residents of other states.

TABLE 4 - MARRIAGES BY RESIDENCE OF BRIDE AND GROOM, GEORGIA, 1957

Resident of Georgia	Number
Total marriages	51,235
Bride and groom	28,725
Bride	2,573
Groom	1,604
Neither	18,026
Not stated	307

There were 8,798 divorces reported in Georgia in 1957, which is an increase of 1,075 over the 7,723 reported in 1956. The divorce rate in 1957 was 2.3 per 1,000 population, as compared to 2.0 in 1956.

Fetal deaths

A fetal death is defined as a delivery of any length gestation that shows no sign of life after complete birth. Prior to 1954, only fetal deaths of "20 or more" weeks gestation were recorded, and they were classified as stillbirths.

In 1954, a new procedure was initiated whereby all fetal deaths, regardless of length of gestation, were recorded and so classified. They were grouped according to length of gestation, so that the total of the two fetal death groupings, "20-27 weeks" and "28 weeks and over" corresponds to what has been classified as stillbirths prior to 1954.

Table 5 shows Georgia fetal deaths for 1957 by race, place of occurrence, attendant and length of gestation. Fetal deaths in 1957, with 3,638 and a ratio of 35.7 per 1,000 live births show the lowest number and ratio since the new procedure of classification was instituted in 1954.

Three thousand and seventy-five (84.5%) of the fetal deaths in 1957 occurred in hospitals as compared with 3,053 (81.8%) in 1956.

TABLE 5 - FETAL DEATHS BY RACE, PLACE OF OCCURRENCE, ATTENDANT AND LENGTH OF GESTATION, GEORGIA, 1957

Race and Length of Gestation	Total	Hospital			Non-hospital			
		Total	Physician	Midwife	Other	Total	Physician	Midwife
Total	3,638	3,075	3,062	2	11	563	285	222
Under 20 weeks	1,480	1,335	1,334	-	1	145	109	27

Unknown	89	62	61	1	-	27	14	7

Live births

A live born child is one who shows any evidence of life (breathing, heart beat, or movement of voluntary muscles) after complete birth.

The 101,882 live births in 1957 is a slight decrease from the 1956 record number of 102,643, but this is the fourth consecutive year in which more than 100,000 live births were recorded. The 1957 live birth rate was 26.4 per 1,000 population compared to 27.1 for 1956. Table 6 shows live birth rates, 1940-1957 adjusted for incomplete registration, and Figure 1, page xi, graphically illustrates the information in this table.

TABLE 6 - LIVE BIRTH RATES, GEORGIA, 1940 - 1957

Year	Rate per 1,000 Population	
	Crude	Adjusted for Incomplete Registration
1940	20.7	25.5
1941	21.6	26.2
1942	23.1	27.5
1943	25.1	29.4
1944	24.7	28.5
1945	24.0	27.3
1946	27.4	30.7
1947	29.2	32.2
1948	28.6	31.1
1949	29.0	31.1
1950	26.7	28.2
1951	26.7	28.1
1952	27.3	28.6
1953	27.0	28.2
1954	27.3	28.4
1955	26.8	27.9
1956	27.1	28.1
1957	26.4	27.3

Since 1928, nonwhite birth rates have been consistently higher than white birth rates. From 1928 to 1950, rates for the nonwhite race showed a gradual increase while white rates remained fairly constant from 1928 to 1942 and increased rapidly from 1942 to 1950. The rates for both races leveled off in 1950 and have remained fairly constant through 1957.

The white and nonwhite birth rates for 1957 are 23.9 and 32.2, respectively. Birth rates for both races are higher in urban than rural areas (see Table I, page 1).

In 1957, approximately 86% of all live births, 98.1% of the white and 63.0% of the nonwhite, occurred in hospitals. This is a 1.2% increase over the proportion which were hospital births in 1956, with most of the increase occurring to the nonwhite births (0.1% increase in white, 2.8% increase in nonwhite).

Immature births

An immature birth is defined as the birth of a live born infant with a weight of $5\frac{1}{2}$ lbs. (2500 grams) or less. If weight is not specified, a live born infant whose period of gestation is less than 37 weeks is considered immature.

Eight thousand, seven hundred and fifty-two (8,752) immature births were reported in 1957, giving a rate of 85.9 per 1,000 live births. This is an increase over 1956 figures of 90 in number and 1.5 in rate.

Births to unwed mothers

On the confidential medical report of live births the question is asked: "Is mother married to father of the child?" For statistical purposes, the answer "no" indicates a birth to an unwed mother. In 1957, there were 10,061 of these births, resulting in a rate of 98.8 per 1,000 live births. This rate is even higher than last year's rate - the highest ever recorded in the state up until that time. The white and nonwhite rates for 1957 are 15.7 and 247.3 per 1,000 live births, respectively.

Births to unwed mothers, by county of residence, are shown in Table XV, page 92.

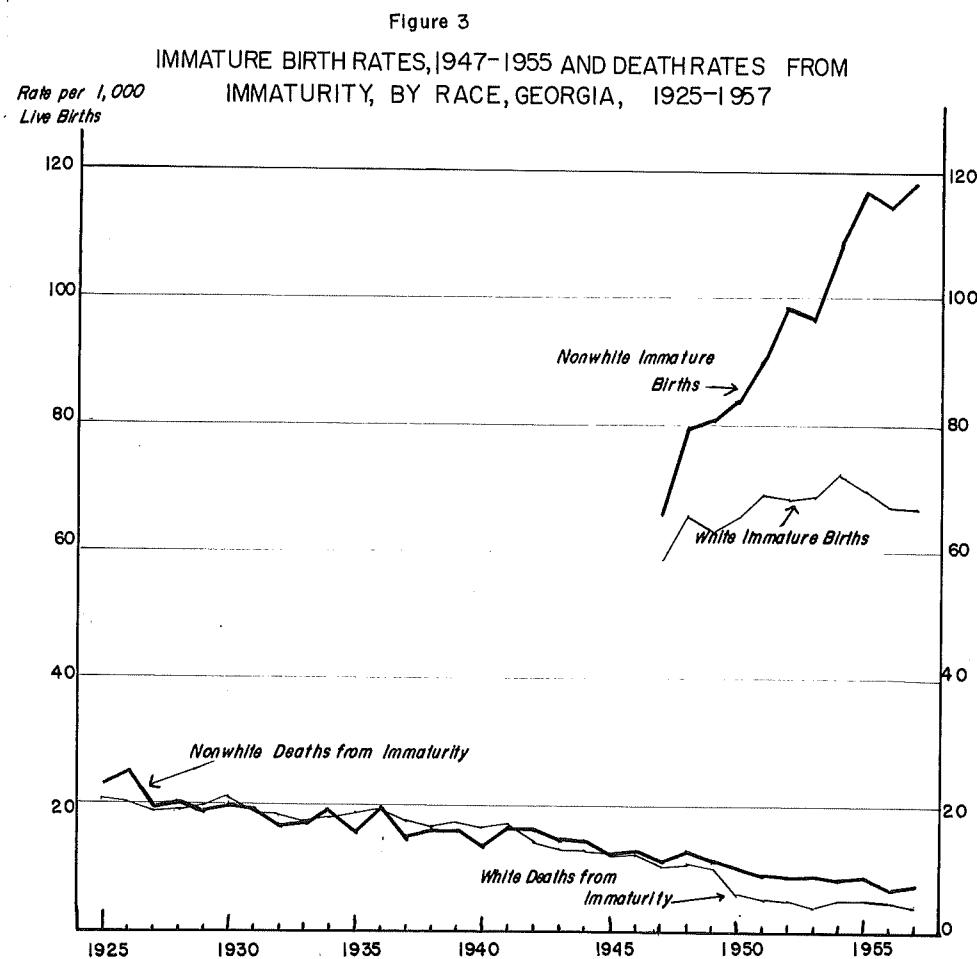

Infant deaths

An infant death is any death occurring during the first year of life. There were 3,099 infant deaths recorded for 1957, with a white rate of 22.7 per 1,000 live births and a nonwhite rate of 44.3. The ten leading causes of death in the under-one-year age group remain the same as for 1956, the only changes being slight shifts in position of the individual causes within the group.

Deaths from immaturity

A death attributed to immaturity is one classified as "Immaturity with mention of other subsidiary causes" or "Immaturity unqualified," sixth revision list numbers 774 and 776, respectively.

Immaturity continues to be the leading cause of infant deaths in the state. In 1957, 579 infant deaths were classified as due to immaturity, giving a rate of 5.7 per 1,000 live births. Both the number and rate reveal a very slight increase over those of 1956, with the increase occurring in the nonwhite population. Figure 3 shows immature birth and death rates by race for Georgia since 1926.

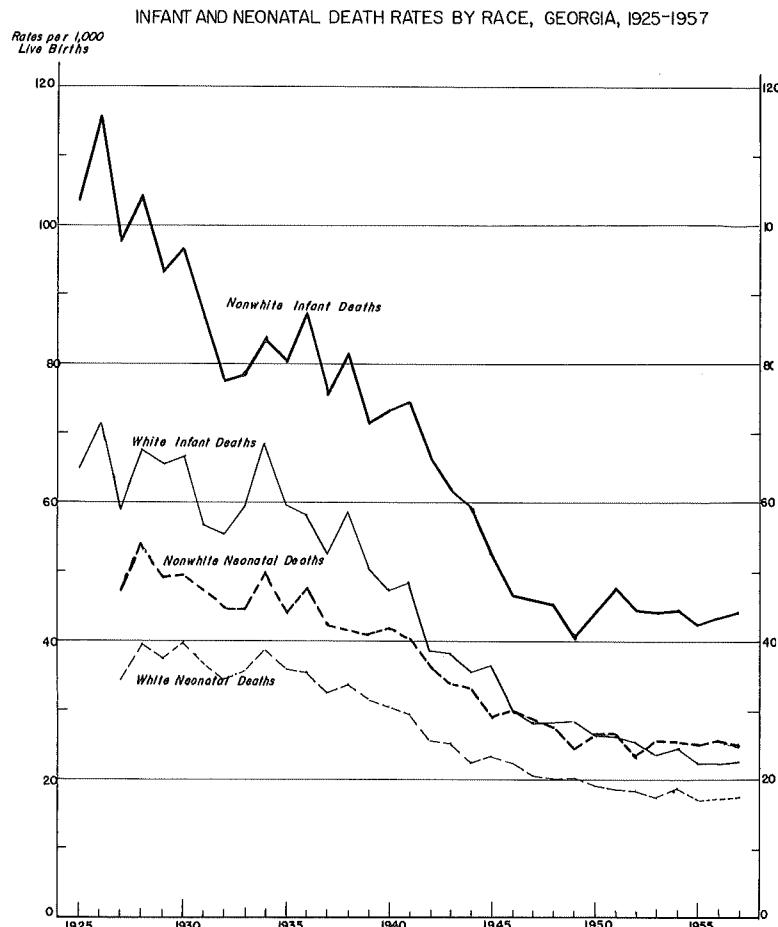

Of the remaining 2,520 infant deaths, 690 were assigned to other causes with mention of immaturity. Thus, immaturity was associated with 40.9% of all infant deaths in 1957, as compared to 39.9% in 1956.

Neonatal deaths

A neonatal death is any death occurring under 28 days of age. The 2,062 neonatal deaths reported for 1957 comprise 66.5% of the total infant deaths for the year.

Approximately 49% of all neonatal deaths occurred to infants under one day of age. This proportion is slightly higher than that for last year, but the rate of 10.0 per 1,000 live births is essentially the same. However, total neonatal deaths have shown a marked decline since 1935. Figure 4 illustrates the decline in the infant and neonatal death rates.

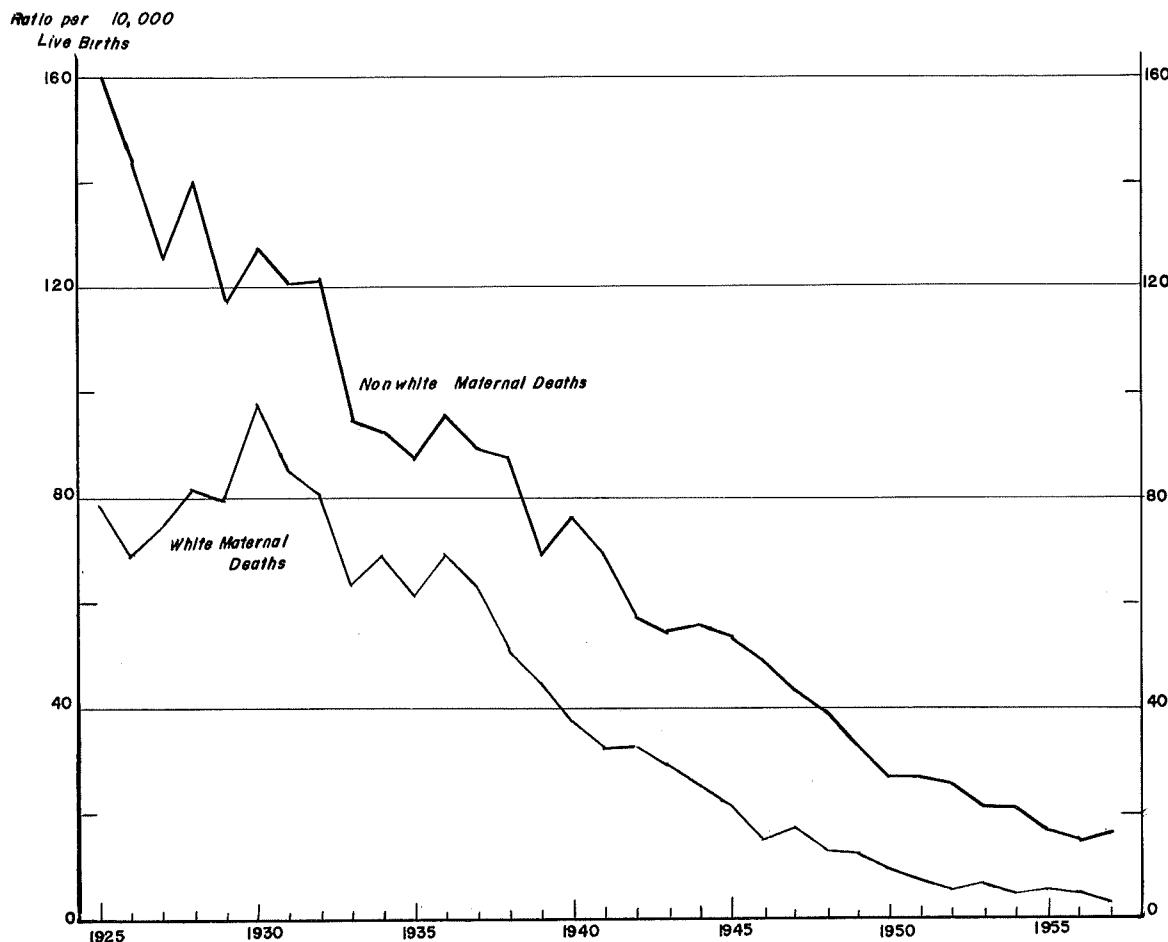

Figure 4

Maternal deaths

A maternal death is a death from complication of pregnancy, childbirth or the puerperium. There were 82 maternal deaths reported for Georgia in 1957. The rate has dropped steadily since 1940, reaching a new low of 8.0 per 10,000 live births in 1957. Figure 5 shows maternal death rates for Georgia since 1924.

Figure 5
MATERNAL DEATH RATIO BY RACE, GEORGIA, 1925 — 1957

Deaths all ages

For the first time since 1948, the crude death rate, 8.6 per 1,000 population, showed an increase over the rate for the preceding year. This increase is believed to be in part to an outbreak of influenza. Approximately 55% of all deaths occurred either during the first year of life or after age 65. Table II shows death rates by age, race and sex. Nonwhite rates are higher than white rates at all ages for both sexes except in the age group 75 years and older.

Heart disease was again the leading cause of death in 1957, with a rate of 272.3 per 100,000 population. This rate was slightly higher than the rate of 262.2 reported for 1956.

The ten leading causes of death remained the same in 1957 as in 1956. However, influenza and pneumonia moved into fourth place and deaths from accidents other than motor-vehicle dropped to fifth. The other causes remained in the same position as in 1956.

Table 7 shows death rates for Georgia adjusted for age and race. The direct method is used with the 1950 United States population as the standard. 1/

1/ This method is discussed in Vital Statistics Rates in the United States 1900-1940, pp. 66-69

TABLE 7 - DEATH RATES PER 100,000 POPULATION FOR GEORGIA AND UNITED STATES - AND

* Estimated by NOVS

Age adjusted death rates for the white race in Georgia are considerably higher than unadjusted rates. On the other hand, nonwhite death rates show little change when adjusted for age. The variations between age adjusted and unadjusted rates are a reflection of differences in the age structure of the population of Georgia as compared with the United States.

Georgia's age-race adjusted rate is somewhat lower than the United States total rate in 1950 and has decreased at a faster rate than the unadjusted total rate for the United States. However, the 1957 adjusted and unadjusted rates are slightly higher than in 1956.

Georgia's adjusted rates are not necessarily comparable with any United States rates except those for 1950, because of changes in the composition of the population of the United States since 1950. To be comparable year by year, United States rates would also have to be adjusted to the basis of the 1950 population.

Deaths by age groups

Heart diseases (International List code numbers 410-443) are the leading cause of death in the age groups of 25-44 years, 45-64 years, and 65 years and over.

In the 5-14 years age group, accidents, excluding motor-vehicle accidents, are the leading cause of death, comprising approximately 28% of the deaths occurring in this age group. These accidents are the second leading cause in the 1-4 and 15-24 years age groups and fall among the ten leading causes in each age group.

Motor-vehicle accidents lead the list of causes for the 15-24 years age group and are second in the 5-14 group and third in the 25-44 years age group.

Deaths from all accidents combined are the leading cause of death for all age groups from one through forty-four years of age.

Violence (all accidents, homicides and suicides) causes approximately 62% of all the deaths of people 15-24 years of age, and 30% of those 25-44 years old. The high percentage of deaths from violence in the 15-24 years age group can be partially attributed to the fact that so few in this age group die from diseases. The age specific rate of deaths from violence is lower in this group than in the 25-44 years age group. (See Tables VI and VI-a).

NOTE: Prior to 1938 all events are by place of occurrence; beginning with 1938 events are by place of residence.

* Part of decrease from 1949 to 1950 is directly attributable to changes in classification of causes of death under the Sixth Revision of the International List of Diseases and Causes of Death.

** Prior to 1954 fetal deaths include only those of twenty or more weeks gestation.

Live birth and death rates are per 1,000 population, maternal death ratios are per 10,000 live births; all other rates and/or ratios are per 1,000 live births.

Not Available - Immature births are not available prior to 1947.

* Rates and ratios: live births are per 1,000 estimated population; immature births, stillbirths, infant deaths, neonatal deaths and deaths from immaturity are per 1,000 live births; maternal deaths are per 10,000 live births; deaths all ages and deaths by cause of death are per 100,000 estimated population.

** No rate can be computed on deaths in 1 - 4 years age group by county or city because 1957 estimated population is not available for that age group.

*** These figures include events occurring in Silvertown.

Jesup	5,800	4,000	1,800				

* Because of problems peculiar to these counties a method other than straight line projection and natural increase was used.

1/ Military population is excluded from the county totals but included in the state total.

2/ The Urban population is the total of the estimates for all incorporated places shown above plus the military population of the state.

3/ Population of state institutions is excluded from the county totals but is included in the state totals.
