INTRODUCTION

This report has been prepared annually since 1947. The format has varied from year to year as efforts are made to present the material in the most useful and concise manner. In 1953, a format which has proved useful over a period of years was introduced and is followed very closely in this report.

Most data for a county or city are together in one table and both counties and cities are in alphabetical sequence. Detailed state data are included for the current year as well as several historical series for 1935-1969.

Most tabulations are based on births, deaths, fetal deaths, marriages and divorces recorded in the Vital Records Service and known births and deaths of Georgia residents which occurred outside of Georgia. Unless specifically stated otherwise, all data on births, deaths and fetal deaths are allocated to place of residence. Marriages are tabulated by place of issuance of licenses and divorces by place in which divorce is granted.

Population estimates and number of physicians by county are also included in this report.

Additional copies of most of the tables and more detailed tabulations of these and other health statistics are available. Address correspondence to:

Georgia Department of Public Health
Biostatistics Service

Atlanta, Georgia 30334

SOME FACTORS INFLUENCING VITAL STATISTICS

Sources of data

The data contained in this report are obtained primarily from certificates of births, deaths, fetal deaths, reports of divorces and annulments, and the marriage registry. Population estimates are compiled in the Biostatistics Service using births, deaths, and school enrollment figures and an intercounty migration factor as measures of increase or decrease, and the latest census as a base. (Copies of these estimates with a description of method used are available upon request.)

Accuracy and completeness of reporting items on certificates

The accuracy and completeness of the reporting of events determine to a great extent the quality of statistics regarding such events.

Unanswered items on certificates result in "unknown" quantities which cannot be interpreted in the analysis of the data, and erroneously answered items create a bias in the data which will affect any conclusions made.

One of the most serious problems in birth and death registration is the allocation of data to urban or rural residence. When a residence is outside the corporate limits of a city and the city is shown as the address, the residence is classified as urban unless the person completing the certificate indicates that the residence is outside the city. This results in an over-allocation of events to urban areas with an under-allocation to rural areas and should be considered in analyzing rural and urban differences.

Population, race and age trends

Georgia's population growth between 1900 and 1960 was primarily in the white segment of the population. During this period the nonwhite population increased by only 8.8%, while the white population increased 138.5%. The racial composition increased from 53.2% white in 1900 to 71.4% in 1960 according to reports of the U.S. Census Bureau.

The urban segment of the population has increased 529.4% since 1900. As of the 1960 Census, the urban portion of the Georgia population comprised 55.3% of the total, compared to 15.6% in 1900. The white urban part had changed from 8.4% in 1900 to 38.9% in 1960, and the nonwhite urban part from 7.2% in 1900 to 16.4% in 1960.

A change has been taking place also in the age composition of Georgia's population. Whereas, the 1900 population was predominantly (62.6%) under 25 years of age, only 48.9% of the 1960 population was under 25 years. Those 65 years or over form 7.4% of the 1960 Census population, over twice the percentage for 1900. These changes are due in most part to the net increase in population, 1900-1960, being distributed 31.1% under 25 years, 56.0% 25-64 years, and 12.9% 65 years and over.

The basic factor in Georgia's population growth has been natural increase (the excess of births over deaths), which amounted to 49,012 persons for the year 1969. Figure 1 illustrates live birth and death rates, by race, for Georgia, 1940-1969. The difference between these two rates for a race is the rate of natural increase for that race.

Figure 1
LIVE BIRTH AND DEATH RATES, BY RACE, GEORGIA, 1940 - 1969

Average age at death

The average age at death for the population as a whole has more than doubled since 1900 when it was only 27.2 years. At the end of the next 40 years (1940) the life span increased to 47.9 years and by 1969 had reached 60.4 years which is an increase in the last 25 years of 12.5 years.

Military events

Vital events occurring on military reservations are included in state totals, but excluded from county totals. The counties most affected by this procedure are Chattahoochee, Liberty, Muscogee and Richmond.

DISCUSSION OF 1969 STATISTICS

Population

The population for July 1, 1959, used in calculating rates for the 1959 data was over-estimated. This must be taken into consideration when analyzing 1959 rates.

The estimated population for Georgia, July 1, 1969, 4,641,000, shows an increase of 34.7% over the Census count for Georgia, April 1, 1950. Approximately 90% of this increase occurred in the white population.

Physicians

As of March 1, 1970, there were 3,927 physicians practicing in Georgia; of this number 3,221 were engaged in private practice, 637 were institutional physicians, and 69 were in public health. There were also 159 retired physicians known to be residing in the State. The ratio of physicians in private practice to civilians was 1 to 1,407. County totals for physicians in private practice are shown in Table XV.

Marriages and Divorces

The 64,003 marriages reported in Georgia in 1969 represent an increase of 2,751 over the 61,252 in 1968, with an increase in rate from 13.4 in 1968 to 13.8 in 1969. This is the largest number of marriages ever reported in Georgia. There were 42,826 first marriages for the groom and 41,783 for the bride. Four thousand three hundred and fifty grooms had 2 or more previous marriages and 4,859 brides had 2 or more previous marriages.

In 1969 there were 19 brides reported as being under 14 years of age, 168 as 14 and 559 reported as 15. The brides in these age groups were married to grooms aged 15 through 69 years, one bride of 15 being reported as having married a man of 69 years.

Table 1 shows marriages occurring in Georgia in 1969, by place of residence of the bride and groom. Approximately 31% of the persons married in Georgia in 1969 were residents of other states, the same percent as in 1968.

TABLE 1 - MARRIAGES BY RESIDENCE OF BRIDE AND GROOM, GEORGIA, 1969

<u>Resident of Georgia</u>	<u>Number</u>
Total Marriages	64,003
Bride and Groom	40,879
Bride Only	3,272
Groom Only	3,025
Neither	16,803
Not Stated	24

There were 17,251 divorces and 64 annulments reported in Georgia in 1969. Divorces increased by 1,751 over the 1968 total. This resulted in a slightly higher divorce rate of 3.7 per 1,000 population as compared with 3.4 for 1968.

Fetal Deaths

A fetal death is defined as a product of conception of any length gestation that shows no sign of life after complete birth. Prior to 1954, only fetal deaths of "20 or more" weeks gestation were recorded, and were classified as stillbirths.

In 1954, a new procedure was initiated in which all products of conception, regardless of length of gestation, were recorded and classified as fetal deaths and grouped according to length of gestation. The total of the two fetal death groupings, "20-27 weeks" and "28 weeks and over", corresponds to the figure given for stillbirths prior to 1954.

Table 2 shows the 2,820 fetal deaths reported in 1969 by race, place of occurrence, attendant and length of gestation. Two thousand, seven hundred and fifteen, or 96.3% of the reported fetal deaths, occurred in hospitals in 1969. This is an increase of 1.2% over 1968.

On 1,096 of the fetal death certificates, the cause of death was stated as unknown. One hundred fifteen listed congenital malformations, 340 were attributed to conditions of placenta, 149 to conditions of the umbilical cord and 482 to conditions of mother including difficult labor, toxemia of pregnancy and maternal conditions unrelated to pregnancy.

TABLE 2 - FETAL DEATHS BY RACE, PLACE OF OCCURRENCE,
ATTENDANT AND LENGTH OF GESTATION, GEORGIA, 1969

Fertility Rates

Fertility rate (per 1,000) is the ratio of all live births in a given year to the number of females aged 15-44 years, times 1,000.

The following table shows fertility rate by race for Georgia, 1960, 1964, 1968, and 1969:

	<u>1960</u>	<u>1964</u>	<u>1968</u>	<u>1969</u>
White	107.9	101.5	80.1	82.4
Nonwhite	156.6	147.9	108.6	108.0

From 1960 through 1964, the period just prior to the formal Family Planning Program, the white rate decreased 6.4 per thousand and the nonwhite 8.7. In the next four-year period the white rate showed a decrease of 21.4 per thousand and the nonwhite 39.3; however, in 1969 the white rate showed an increase of 2.3 per thousand over 1968. The nonwhite rate continued to decrease (0.6 from 1968).

Figure 2
FERTILITY RATES BY RACE, GEORGIA, 1960, 1964, 1968, AND 1969

* Rates are live births per 1,000 females aged 15-44 years.

A form is filled out for each live-born child in Georgia and the degree of accuracy of the statistics on live births presented in this report is determined by the accuracy of the data supplied on this certificate.

A copy of the certificate which has been in use since January 1, 1959, is shown below.

ADM. 5.1

Live Births

A live-born infant is one who shows any evidence of life (breathing, heart beat, or movement of voluntary muscles) after complete birth.

In 1956, there were 102,643 live births recorded as occurring to residents of Georgia, the largest number on record for any one year. In 1957 the number of live births began to decline and in 1967, the lowest number occurred since 1946 (86,467). In 1969 there were 90,195 live births, an increase of 2,873 over the 87,322 occurring in 1968. All of the increase occurred in the white births while the nonwhite decreased by 65.

Since 1928, nonwhite birth rates have been consistently higher than white birth rates. Rates for the nonwhite race showed a gradual increase from 1928 to 1950, while white rates remained fairly constant from 1928 to 1942 and increased rapidly from 1942 to 1950. The rates for both races leveled off in 1950 and remained fairly constant through 1957, but have shown a decided decrease since that year.

The white and nonwhite birth rates for 1969 are 17.8 and 24.1 per 1,000 population, respectively. (See Table I, page 1.)

In 1969, 96.0% of all live births (99.7% of the white and 88.1% of the nonwhite) occurred in hospitals. This represents an increase of 1.5% over the corresponding percentage for 1968 and can be largely attributed to the increased percentage of nonwhite births occurring in hospitals.

Births to Unwed Mothers

Prior to 1959, on the medical report the question was asked "Is mother married to father of the child?" For statistical purposes, the answer "no" indicated a birth to an unwed mother. This question has not been posed since 1958, but if the father's name does not appear on the birth certificate, the event is statistically classified as a birth to an unwed mother. This change should affect interpretation of rates for years after 1958. The total rate of 112.9 births to unwed mothers in 1969 represents a decrease from 1968 of 2.1 per 1,000 live births with the individual rates being 34.9 for the white and 280.5 for the nonwhite.

Immature Births

An immature birth is defined as the birth of a live born infant with a weight of 5 1/2 pounds (2500 grams) or less. If weight is not specified, a live born infant whose length of gestation is less than 37 weeks is considered immature.

There were 8,375 immature births recorded in 1969, compared with 8,261 in 1968, with a change in rate from 94.6 per 1,000 live births in 1968 to 92.5 in 1969. This was a total increase of 114, the white increasing by 45 and the nonwhite by 69. Since 1948 the immature birth rate has increased from 71.0 per 1,000 live births to 92.5 in 1969.

A death attributed to immaturity is one classified as "Immaturity unqualified" (Eighth Revision List Number 777).

In 1969, as in 1968, the Eighth Revision List of causes of death was used in coding. This revision does not give a code for "immaturity with mention of other subsidiary causes" as did the Seventh Revision, so that we are able to get only the deaths from immaturity where the one cause listed is immaturity. There were 205 of these in 1969 but this figure is comparable only to the figure for 1968 (250).

Infant Deaths

An infant death is any death occurring during the first year of postnatal life. There were 2,060 infant deaths recorded in 1969, with a white rate of 17.3 per 1,000 live births and a nonwhite rate of 34.6.

The number one killer of infants in 1969 was pneumonia, causing the death of 330 infants. Second was congenital malformations, (266) and postnatal asphyxia and atelectasis in third place (253).

Neonatal deaths

A death occurring during the first 27 days of life is classified as a neonatal death. The 1,435 neonatal deaths reported for 1969 comprise 69.7% of the total infant deaths for the year and show an increase of 3.4% over the 66.3% in 1968.

Deaths in this age group in 1969 show a decrease in number and in rate for both white and nonwhite. A 2.6% decrease in neonatal deaths from the 1968 total was the consequent result. Approximately 52% of all neonatal deaths occurred to infants under one day of age.

Figure 3 illustrates the trend of infant and neonatal death rates from 1940-1969.

Figure 3
INFANT AND NEONATAL DEATH RATES BY RACE, GEORGIA, 1940 - 1969

Maternal Deaths

The term "maternal death" describes a death resulting from complications of pregnancy, childbirth or the puerperium. There were 29 such deaths reported for Georgia in 1969, a decrease of 1 from 1968. The rate has declined steadily since 1940 except for a slight incremental trend 1963 through 1965. Figure 4 shows maternal death rates for Georgia since 1940. The ratio of 3.2 per 10,000 live births in 1969 is a decrease of .2 from 1968. The white ratio for 1969 is slightly higher than the 1968 ratio (1.5), all the decrease occurring in the nonwhite ratio.

Figure 4
MATERNAL DEATH RATIO BY RACE, GEORGIA, 1940 - 1969

Deaths, all ages

The crude death rate has shown a continuous decrease since 1924 with only slight fluctuations. The rate for 1969 is 8.9 deaths per 1,000 population in comparison with 9.0 in 1968.

Deaths from heart disease, the leading cause of death in the nation as well as in Georgia, increase in number each year. In 1969, Georgia had 13,818 such deaths, with a rate of 297.7 per 100,000 population. This represents a 2.4% increase over the 1968 total, 13,493.

Table 3 shows death rates for Georgia adjusted for age and race. The direct method is used with the 1950 United States population as the standard for 1950, and the 1960 United States population for 1960-1969.¹

TABLE 3 - DEATH RATES PER 100,000 POPULATION FOR GEORGIA AND UNITED STATES, AND DEATH RATES ADJUSTED FOR AGE AND RACE, GEORGIA, 1950 AND 1960-1969

Year	Reported Death Rates						Georgia Rates Adjusted For:		
	United States			Georgia			Age & Race	Age Only	
	Total	White	Nonwhite	Total	White	Nonwhite	Total	White	Nonwhite

*Estimated

Age adjusted death rates for the white race in Georgia are considerably higher than the unadjusted rates. On the other hand, nonwhite death rates show little change when adjusted for age. The variations between age adjusted and unadjusted rates seem to point up the differences in age stratification of the population in Georgia as compared with that of the United States as a whole.

Georgia's adjusted rates are not necessarily comparable with any rates for the United States, except those for 1950 and 1960, because of changes in the composition of the population of the United States between the two census years. To facilitate comparisons on an annual basis, the United States rates would have to be adjusted on the basis of the 1950 and 1960 population.

Deaths by age groups

Heart diseases (International List Code numbers 390-398, 402, 404, 410-429) represent the leading cause of death in the 25-44 years, 45-64 years, and 65 years and over age groups.

Motor vehicle accidents were the leading cause of death in two age groups, 5-14 and 15-24, in 1969. They were responsible for 26.9% of all deaths occurring in the 5-14 years group which is 2.1% lower than the 29% in 1968; however, approximately 42% of all deaths in the 15-24 years age group resulted from motor vehicle accidents, the same as for 1968.

¹ This method is discussed in Vital Statistics Rates in the United States 1900-1940, pp. 66-69, U. S. Department of Commerce, Bureau of the Census, Washington Government Printing Office, 1943.

Accidents other than motor vehicle accidents were the number one killer (20.4%) of children 1-4 years old in 1969, with influenza and pneumonia in second place, and accounting for 15.3% of the deaths in this age group. In 1969 both accidents and influenza and pneumonia combined make up a lower per cent of the deaths in this age group than in 1968, (35.7% in 1969 against 40% in 1968.)

In the past 11 years, accidents other than motor vehicle accidents appear in the ten leading causes of death for every age category.

Deaths due to accidents of all types represent the leading cause of death for all age groups from one through 44 years of age in 1969.

Death by violence (all accidents, homicides, and suicides) accounted for 76% of all deaths for those 15-24 years of age, 54% of those 5-14 years old, and 36% for those 25-44 years of age. The age specific rate of deaths by violence per 100,000 population for the 15-24 years age group went up from 106.4 in 1968 to 120.5 in 1969; whereas, this rate for the 25-44 years old group dropped from 114.2 in 1968 to 107.0 in 1969.

(See Tables VI-A and VI-B)

A copy of the certificate used to record deaths is shown below:

CERTIFICATE OF DEATH				State File No. _____

NOTE: Prior to 1938 all events are by place of occurrence; beginning with 1938 events are by place of residence.

*Part of decrease from 1949 to 1950 is directly attributable to changes in classification of causes of death under the Sixth Revision of the International List of Diseases and Causes of Death. Deaths from immaturity in 1968 and 1969 not comparable to previous years due to Eighth Revision of International List of Diseases and Causes of Death.

TABLE III - SUMMARY OF SELECTED VITAL STATISTICS, GEORGIA, 1935, 1940, 1945 - 1969 (CONT'D.)

** Prior to 1954 fetal deaths include only those of twenty or more weeks gestation.

*** Race breakdown will not add to total due to events of unknown race.
 Live birth and death rates are per 1,000 population, maternal death ratios are per 10,000 live births; all other rates and/or ratios are per 1,000 live births. Not Available - Immature births are not available prior to 1947.

TABLE VI-A
 IMPORTANT CAUSES OF DEATH, NUMBER AND RATE IN SPECIFIED AGE GROUPS,
 BY RACE, GEORGIA, 1969

Rank	Age, Cause of Death and Eighth Revision of International List Number	Number			Rate per 100,000 Population		
		Total	White	Nonwhite	Total	White	Nonwhite

TABLE VI-B
 IMPORTANT CAUSES OF DEATH, NUMBER AND PER CENT IN SPECIFIED AGE GROUPS, GEORGIA, 1969
 (A cause of death must account for at least 5% of all deaths in a given age group to appear in the chart)

	Cause of Death*	Number	Per Cent	
TOTAL, ALL AGES				
<p>A pie chart for 'TOTAL, ALL AGES' showing four main categories: Heart Disease (the largest slice, dark grey), Cancer (medium slice, light grey), Cerebrovascular Disease (medium slice, white), and All Other Causes (medium slice, white).</p>	Total, all causes	41,183	100.0	
	Heart disease	13,818	33.6	
	Cancer	5,723	13.9	
	Cerebrovascular Disease	5,714	13.9	
	Influenza and Pneumonia	1,901	4.6	
	Motor vehicle accidents	1,750	4.2	
	All other accidents	1,447	3.5	
	Diseases of veins and arteries	1,097	2.7	
	Birth injuries, immaturity and other causes of deaths of early infancy	1,088	2.6	
	Other diseases of the respiratory system	970	2.3	
	Homicides	737	1.8	
	Diabetes mellitus	737	1.8	
	All other causes	6,201	15.1	
	UNDER ONE YEAR			
<p>A pie chart for 'UNDER ONE YEAR' showing eight categories: Influenza & Pneumonia (dark grey), Cong. Malfs. (light grey), Asphyxia & Atelectasis (medium grey), Imaturity (white), Anoxia & Hypoxia (white), Hyaline Mem. (white), Conditions of Mother (white), and All Other Causes (white).</p>	Total, all causes	2,060	100.0	
	Influenza and Pneumonia	341	16.6	
	Congenital malformations	266	12.9	
	Postnatal asphyxia and atelectasis	253	12.3	
	Immaturity	205	10.0	
	Conditions of mother including difficult labor	168	8.2	
	Hyaline membrane	145	7.0	
	Anoxic and hypoxic conditions	141	6.8	
	Accidents other than motor vehicle	62	3.0	
	Symptoms and ill-defined conditions	61	3.0	
	Certain gastrointestinal diseases	57	2.8	
	All other causes	361	17.5	
	ONE-FOUR YEARS			
	<p>A pie chart for 'ONE-FOUR YEARS' showing six categories: Other Accidents (dark grey), Influenza & Pneumonia (medium grey), Motor Vehicle Accidents (white), Cong. Malfs. (white), Cancer (white), and All Other Causes (white).</p>	Total, All causes	372	100.0
Accidents other than motor vehicle		76	20.4	
Influenza and pneumonia		57	15.3	
Motor vehicle accidents		55	14.8	
Congenital malformations		47	12.6	
Cancer		23	6.2	
Other diseases of respiratory system		15	4.0	
Meningococcal infections		13	3.5	
Inflammatory diseases of central nervous system		12	3.2	
Other infective and parasitic diseases		12	3.2	
Other diseases of the central nervous system		11	3.0	
All other causes		51	13.7	

TABLE VI-B

* Rates and ratios: live birth rates are per 1,000 estimated population; deaths all ages and deaths by cause of death are per 100,000 estimated population; maternal death ratios are per 10,000 live births and all other rates are per 1,000 live births.

** No rate can be computed on deaths in 1 - 4 years age group by county because estimated population for that age group is not available.

NOTE: Rates on total deaths and total live births by city cannot be computed because no estimates of city population were made for 1969.

(pt. Thomas County)	600	300	300
(pt. Decatur County)	300	200	100

POPULATION ESTIMATE, GEORGIA, JULY 1, 1969

NOTES:

- ^{1/} State total population includes all persons residing in the State on estimate date.
- ^{2/} State total civilian population excludes Armed Forces population.
- ^{3/} All county figures exclude Armed Forces population, on-base dependents of Armed Forces and State institutional population.
- ^{4/} Institutional population includes only those State institutions which have had a census of 500 or more persons since 1960.

METHOD OF ESTIMATION:

The estimated population for each county is a composite of 1960 census base civilian population, natural increase (excess of births over deaths), and net migration (excess of immigration over emigration).

Net migration was estimated by Component Method II of the U.S. Bureau of the Census.

The estimated total population by age, sex and race is an average of (1) the distribution of the population according to the 1960 census and (2) a distribution obtained by a vital rates method.

All figures were adjusted pro rata to sum to the U.S. Bureau of the Census estimates of state population published in "Current Population Reports", Series P-25, No. 436.

INTRODUCTION

This report provides data on the reported incidence of notifiable diseases in Georgia in 1969, by county of occurrence, age and race of case, and month reported. The initial report was issued in 1948.

The statistics herein are based on cases reported by private physicians to the Division of Epidemiology. Sources of reports include county health departments, military and veterans hospitals, death certificates, the Georgia Department of Public Health Laboratories, Tuberculosis Control Service, and Venereal Disease Control Section. Cases of diphtheria, malaria, poliomyelitis, salmonellosis, shigellosis, and all zoonoses, particularly encephalitides suspected of being insect-borne, psittacosis, and rickettsial diseases, are each confirmed through investigation by the Epidemiologic Investigation Branch.

Completeness of data varies with disease and locale, as reporting of cases is influenced by popular interest, availability of effective treatment, hospital procedures, and emphasis placed on reporting by local health departments. Some diseases are generally well reported, due to rarity of occurrence, registration for state-supported treatment, intensive case-finding programs, the limelight of public attention, or the use of state laboratories in connection with diagnosis. These include poliomyelitis, venereal diseases, tuberculosis, malaria, rabies, infectious hepatitis, rickettsial diseases, diphtheria, and typhoid fever. Diseases believed poorly reported are meningitis other than tuberculous or meningococcal, rheumatic fever, tetanus, influenza, measles, staphylococcal infections, streptococcal infections, and whooping cough.

These factors should be considered in the interpretation of the data in the report. Also, care must be taken in considering rates based on small numbers.

In addition to the figures compiled from official sources, another estimate of occurrence of disease in Georgia has been sought by contacting physicians. Prior to 1959, each physician in Georgia received weekly a post-paid, addressed form card, but few cards were returned. Since that year, a random 10% sample of all general practitioners and pediatricians was chosen weekly for contact by cards. Starting in 1968, internists were included. For some of the reportable diseases and certain other notifiable diseases, the estimates made on the basis of the 1969 data thus obtained are given in Table III-B. The Epidemiology Section of the Department's annual descriptive report contains a comparison of direct and sampling reports for all notifiable diseases.

Diseases are classified according to the 8th Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

Other health statistics may be obtained from the Georgia Department of Public Health, Biostatistics Service, 47 Trinity Avenue, S. W., Atlanta, Georgia 30334.

SUMMARY

On the following pages are presented summaries and additional details of the data contained in General Tables.

Dysentery

The dysentery case rate in 1969 was 12.4 per 100,000 population comparing with 14.8 in 1968 and 17.5 in 1967. Shigellosis comprised 99.7% (576 of 578) of the cases. The remaining 4 cases were amebiasis, a condition which rarely becomes acute, inasmuch as random surveys in Georgia have shown that 3% of the small populations tested were asymptomatic carriers.

Diphtheria

Twelve cases occurred, resulting in no deaths.

Isolants of Corynebacterium diphtheriae were made from specimens submitted by 23 individuals in 1969. Positive specimens for 18 individuals came from throat cultures but for 5 individuals isolants were obtained from skin lesions. All of the latter isolants were C. diphtheriae mitis - nontoxigenic and came from Chatham County.

Only 7 of the 23 individuals showed clinical signs of diphtheria infection. Organisms from these individuals were typed as mitis - toxigenic as were those from 7 other individuals who were colonized but asymptomatic. Except for a single C. diphtheriae gravis - nontoxigenic, the remaining isolants were mitis - nontoxigenic.

Hookworm disease

The rate of identified cases of hookworm disease in Georgia has dropped yearly, from 610.3 cases per 100,000 population in 1950 to 25.1 in 1969 (1,164 cases were reported in 1969). All cases are reported from laboratory findings.

This infection occurs in the Coastal Plain of southern Georgia. Only isolated cases appear in hilly north Georgia. The infection is minimal in most patients.

Infectious hepatitis

In 1969, 895 cases were reported, a rate of 19.3 cases per 100,000 population. Included in this number were 88 cases of serum hepatitis. Primarily 5-24 year olds were attacked, 30% of the cases being 5-14 years old and 32%, 15-24 years old. Case rates were 29.5 per 100,000 population in the 5-14 age group, 32.8 in the 15-24 group. Twenty-four deaths were recorded to infectious and serum hepatitis.

The deaths of two teenagers in Savannah in December 1969 resulted in an extensive investigation into narcotics-associated hepatitis in that South Georgia city. A total of 107 cases of hepatitis with onsets in the period from November 1, 1967 - January 31, 1970 was documented as part of the investigation. Most of these cases had admitted contact with at least one other known case through sharing needles in the use of parenterally administered narcotics and are considered cases of serum

hepatitis. The largest number of cases - 64 including the 2 cases terminating in death - occurred in the 15-19 year age group, predominantly in white children identified with the middle socioeconomic class of the community.

Meningococcal infections

There were 82 cases reported in 1969. Forty-three per cent of the reported cases were under 5 years old. The rate in this group was 7.2 reported cases per 100,000 population, whereas the overall rate was 1.8. Twenty-four of the cases were military personnel.

Meningitis, other than meningococcal or tuberculous

Under this classification, added to the notifiable list in 1956, 73 cases were reported in 1969, or 1.6 cases per 100,000 population. Twenty-three cases occurred in persons under 1 year old, with a rate of 25.9 cases per 100,000 population

Poliomyelitis

No cases have been reported since 1966 in Georgia.

Psittacosis

One case was reported in 1969, the first in Georgia since 1964. The number of cases rose from 1 in 1952 to 14 in 1955, as parakeets became popular household pets. Banding of parakeets, according to state law, enabled epidemiologists to trace infected birds and halt sales from infected aviaries. In 1956 the number of cases began to decline.

Salmonellosis

There were 799 cases reported in 1969, 92.7% of these reports being derived from laboratory findings on specimens submitted by private physicians for identification and typing. The case rate was 17.2 per 100,000 population; 120 cases were under 1 year, with a rate of 135.3. No deaths were recorded from salmonellosis.

The trend of isolating Salmonella from an increasing number of Georgia residents continued in 1969 although the increase over 1968 was small. There were isolations from 779 individuals in 1969 as compared to 757 individuals in 1968, an increase of 2.9 percent. A larger portion of the 1969 total came through follow-up on contacts to known cases and a smaller portion of the total from individuals demonstrating symptoms of infection.

Although salmonellas have become so ubiquitous as to prevent identification of source in most infections, a few serotypes are associated most often with a single source. Investigations carried out to identify the source of S. java and S. litchfield infections proved 5 of the cases caused by one of these two serotypes originated by contact with turtles. Contact with animals could have been the source of other infections, also. Most cases, however, are considered to be caused by the ingestion of contaminated food.

Tetanus

Of the 8 cases reported, 6 were first reported by death certificates, with 1 death from tetanus neonatorum. The rate was 0.2 per 100,000 population. Four of the cases were females, four were males.

Tularemia

Four cases were reported, with a rate of 0.1 per 100,000 population.

Rickettsial diseases

Rocky Mountain Spotted fever

This disease, communicated by the bite of an infected American dog tick, occurs mostly in the Northern Mountain and Piedmont sections of Georgia. Sixteen cases were reported in 1969, with a rate of 0.3 per 100,000 population. There were no deaths from this disease.

Typhus fever

One case was reported in 1969. Prior to 1946, the case total ran consistently in excess of 1,000 per year.

Venereal diseases

In 1969, there were 26,883 cases reported, compared with 23,800 in 1968, giving an increase of 3,033 cases. The total rate, 579.3, in 1969, was greater than the 1968 rate of 521.0 per 100,000 population.

Gonorrhoea, with 23,416 cases reported, comprised 87% of the reported cases of venereal diseases in 1969.

The 1969 case rate for primary and secondary syphilis was greater than the 1968 rate, (24.9 and 19.5, respectively).

Rheumatic fever

Eighty-nine cases were reported in 1969, with a rate of 1.9 cases per 100,000 population; seventy-nine of these cases were reported by the Cardio-vascular Division Program, the first year this has been done. There were 11 deaths listed as due to this disease in 1969.

Tuberculosis

Table A provides numbers and rates of newly reported active and probably active cases in 1969, allowing comparison with respect to race, sex and age. The classification "active or probably active" includes cases for which tubercle bacilli were demonstrated and cases for which activity was indicated by chest X-rays, unexplained pleurisy with effusion, or clinically active extra-pulmonary tuberculosis.

The total number and rate of newly reported cases is less in 1969 than in 1968. The number decreased from 1,074 in 1968 to 983 in 1969 and the rate from 23.5 to 21.2.

For "active or probably active" cases in both white and nonwhite the rate is higher for males than for females.

TABLE A
NEWLY REPORTED TUBERCULOSIS, "ACTIVE OR PROBABLY ACTIVE" CASES,
BY RACE, SEX AND AGE GROUPS,
GEORGIA, 1969

Race and Sex	Age in Years							Unknown

Female	31.7	25.4	14.4	29.3	45.5	34.3	33.1	...

Typhoid fever

Fifteen cases occurred, with no deaths resulting. The overall rate was 0.3 cases per 100,000 population.

A total of 9 cases of typhoid fever (etiological agent, S. typhosa) and 5 new typhoid carriers were documented in 1969. Four of the cases were associated in a single outbreak in Atlanta. The source of these infections could not be identified.

Undulant fever

Four cases were reported in 1969, with a rate of 0.1 per 100,000 population.

Infectious encephalitis

Seven cases of infectious encephalitis, unspecified, were reported in 1969, with a rate of 0.2 cases per 100,000 population, and a fatality rate of 85.7 per 100 reported cases.

Specified communicable diseases

Morbidity data are so incomplete for the following diseases that it is of advantage to mention the mortality data also.

Disease	Reported Data		Rates per 100,000 Population	
	Cases	Deaths	Cases	Deaths
Influenza	335	236	7.2	5.1
Measles	2	1	0.0	0.0
Streptococcal Infections	422	2	9.1	0.0
Whooping cough	9	-	0.2	0
German measles	76	-	1.6	0

Scarlet fever and streptococcal sore throat are included in the streptococcal infections.

Deaths are reported by place of residence.

Rabies in Man

No cases of rabies in man have been reported since 1960.

Malaria

In 1969, 284 cases of malaria were reported. All were military personnel or returning from overseas assignment.

Shigellosis

Five hundred, seventy-six cases were reported in 1969, resulting in a rate of 12.4 per 100,000 population. Three deaths were recorded for this disease, all under 5 years of age.

Shigella was isolated from specimens submitted by 593 individuals in 1969, a 11.6 percent decrease from the 671 isolations of 1968. Approximately half of these were individuals of the Atlanta area who visited Grady Memorial Hospital inpatient or outpatient facilities. Many cases were associated with at least one other by family or neighborhood contact. Twenty-one isolations were made on patients in one of the State hospitals.

Cases of Shigella by serotype in Georgia in 1969 were:

Serotype	Number
flexneri 1	10
flexneri 2	102
flexneri 3	86
flexneri 4	8
flexneri 6	<u>15</u>
Subtotal	221
sonnei	<u>372</u>
Total	593
