INTRODUCTION AND OVERVIEW

SECTION I

INTRODUCTION AND OVERVIEW

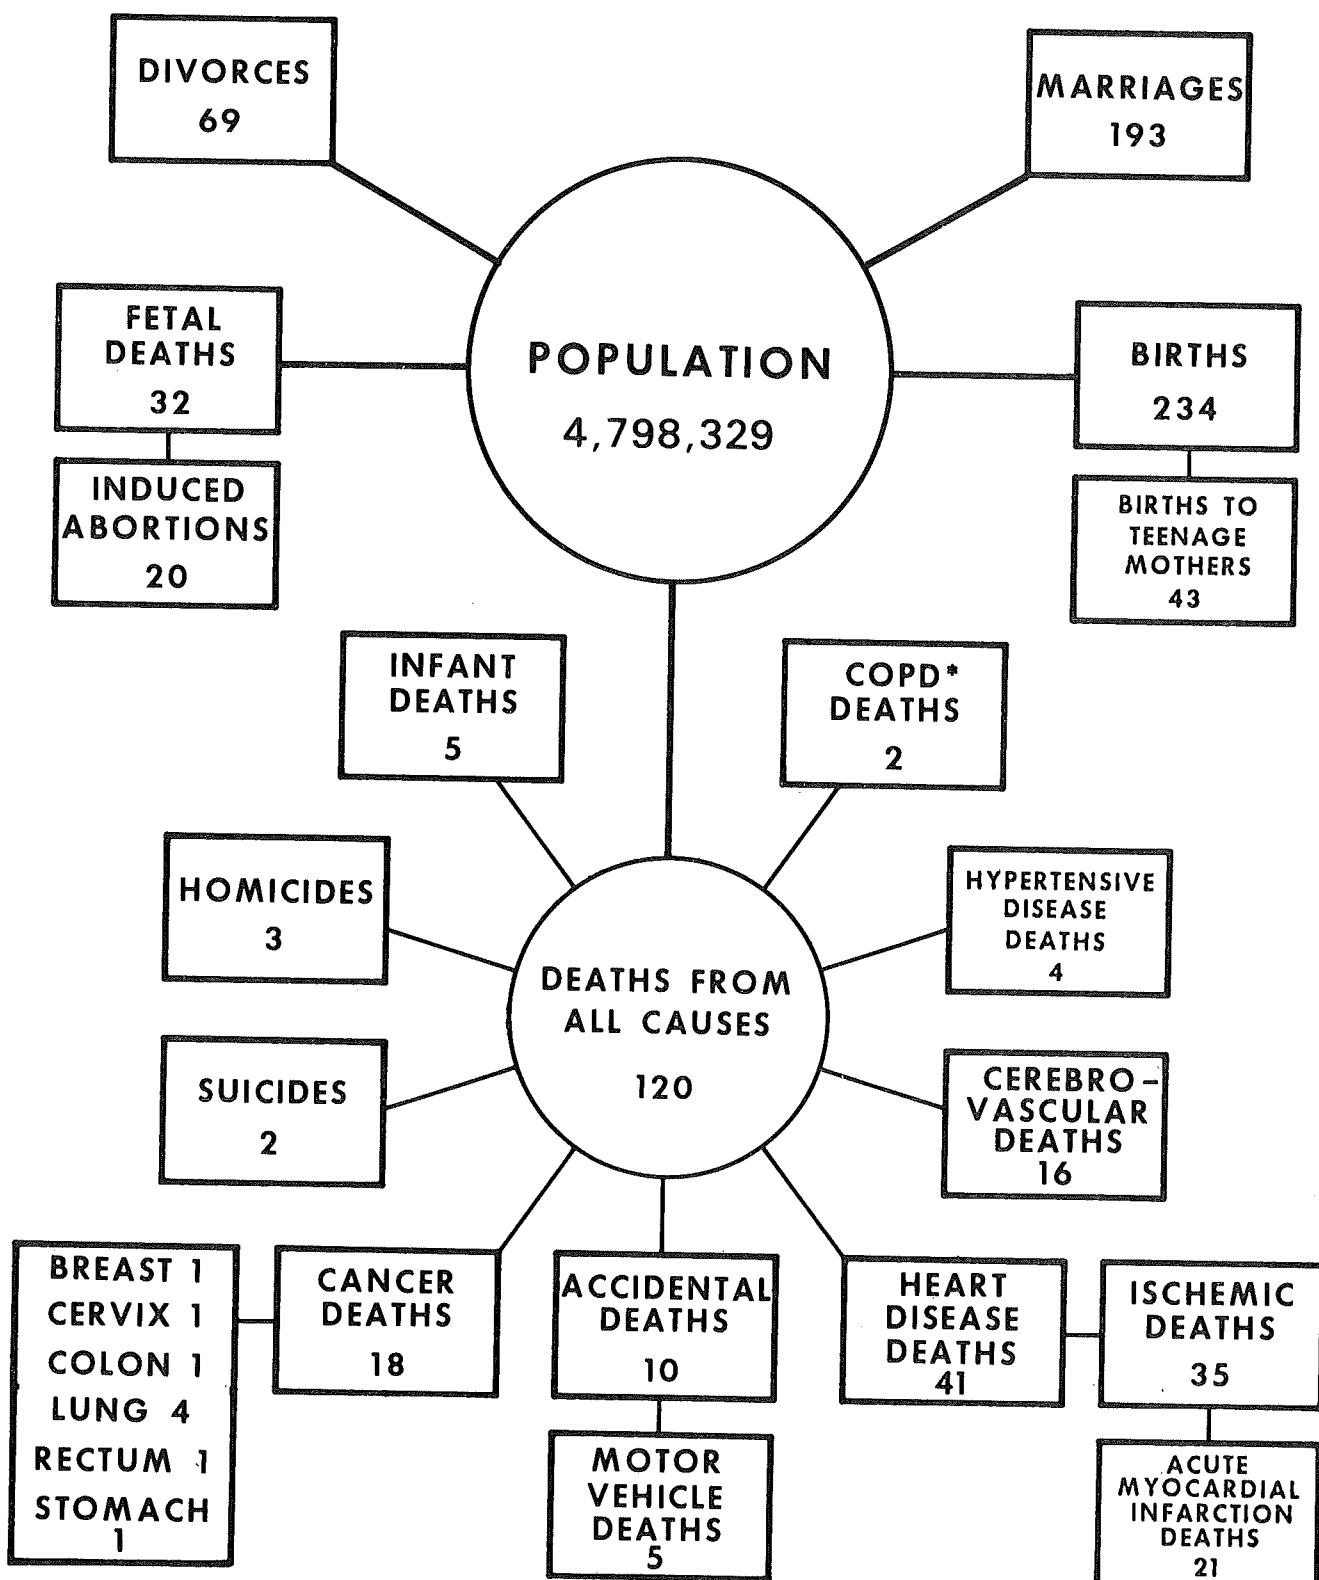

A barometer of the quality of life for Georgia residents may be partially found in the analysis of events that are vital to their health and welfare. Specific events that relate to health well-being in Georgia are presented in this volume, the 1973 Vital and Health Statistics. For instance, the traditional indicators of birth, death, marriage, and divorce are included. In addition, sections on population trends and trends of life occurrences are incorporated. Features of particular interest are the seasonal and yearly trends that are demonstrated by the health data and the spatial patterns of selected events illustrated by computer mapping.

We believe this 1973 volume provides useful information for all phases of planning, including that of health planning. However, it is the purpose of the Health Services Research and Statistics Section to continually improve this volume, and this purpose may only be accomplished by knowing the needs and feelings of its users. Thus, we ask for any comments that will help us to make future volumes more useful.

AVERAGE DAILY EVENTS IN GEORGIA, 1973

An overview of the vital events in Georgia is provided by Figure 1. In 1973, the total projected population was 4,798,329. The dynamics of population change are reflected in the events of births, deaths, and

**EACH DAY DURING 1973,
GEORGIA AVERAGED APPROXIMATELY:**

*CHRONIC OBSTRUCTIVE PULMONARY DISEASE - INCLUDES ASTHMA, EMPHYSEMA, AND BRONCHITIS

Figure 1

migration, of which birth and deaths are shown by Figure 1. The chart reflects the average daily occurrences of selected events that affect the dynamics of population change in Georgia. The migration component of this process of population change is accounted for in another volume, Georgia Population Projections, 1975 and 1980, June 1975.

SOURCE AND COMPLETENESS OF DATA

Georgia law requires that certificates of vital events be submitted to the Vital Records Unit, Division of Physical Health, Department of Human Resources. The Vital Records Unit has the responsibility of recording and preserving the submitted documents. However, the Health Services Research and Statistics Section provides the tabulations, summaries, analyses, and dissemination of the statistical information.

The data presented in this volume were obtained primarily from the Vital Records computer tapes. Additional information was obtained from the National Center for Health Statistics and the Health Services Research and Statistics (HSRS) Section in the Division of Physical Health. Specifically, United States trend information was gleaned from the national sources, and the population data was obtained from the HSRS Section.

The validity of any information is dependent upon the accuracy and completeness of the reporting system. Problems such as unanswered portions of certificates and the allocation of events to urban or rural residence have impacts on the quality of the information. Thus, "unknown" questions and erroneously answered items create a bias in the data which may confound

scientific and experimental inquiry. Allocation of events by residence should be carefully reviewed if an individual is analyzing urban/rural differences; otherwise, this variation will present little difficulty in data analysis.

DEFINITIONS

Because of ambiguity in many sources of data, it becomes necessary to define the terms used in a report. This report utilizes many terms and technical connotations that must be defined so meaningful interpretation of the data by the reader may be encouraged. The following list of definitions should prove useful.

TERMS

RESIDENCE: Usual place of residence for that person by specific event. Mother's usual residence is utilized for birth and fetal death events.

RACE: Tables and figures that include race classifications are tabulated by white and black categories only. The black category includes about 99% black and less than 1% other races.

TOTAL BIRTHS: Live births and fetal deaths.

LIVE BIRTH: Defined as one who shows any evidence of life (breathing, heart beat, or movement of voluntary muscles) after complete birth.

IMMATURE BIRTH: Defined as a live birth with a weight of 5½ pounds (2500 grams) or less. If weight is not specified, a live birth whose length of gestation is less than 37 weeks is considered immature.

BIRTH TO UNWED MOTHER: If the father's name does not appear on the birth certificate, then the event is statistically classified as a birth to an unwed mother. Many other states use the term, "illegitimate" birth.

FETAL DEATH: A fetal death is defined as a product of conception of any length gestation that shows no sign of life after complete birth. Prior to 1954, only fetal deaths of 20 or more weeks' gestation were recorded and were classified as stillbirths.

MATERNAL DEATH: A death resulting from complications of pregnancy, childbirth, or puerperium.

INFANT DEATH: A death occurring during the first year of life.

NEONATAL DEATH: A death occurring to a child under 28 days of age.

PERINATAL MORTALITY: Death of fetus or newborn infant occurring near the expected time of birth. Perinatal Period I: fetal death of 28 or more weeks' gestation and infant death occurring the first seven days of life. Perinatal Period II: fetal death of 20 or more

weeks' gestation and infant death occurring in
the first 28 days of life.

LIVE BIRTH ORDER: Defined as the number equal to the number of previous live births plus current birth.

TECHNICAL NOTES:

<i>CRUDE BIRTH RATE</i>	=	$\frac{\text{total live births}}{\text{total population}}$	X	1,000
<i>IMMATURE BIRTH RATE</i>	=	$\frac{\text{total immature births}}{\text{total live births}}$	X	1,000
<i>LIVE BIRTH TO UNWED MOTHER RATE</i>	=	$\frac{\text{total live births to unwed mothers}}{\text{total live births}}$	X	1,000
<i>CRUDE DEATH RATE</i>	=	$\frac{\text{total deaths}}{\text{total population}}$	X	1,000
<i>INFANT DEATH RATE</i>	=	$\frac{\text{deaths under 1 year of age}}{\text{total live births}}$	X	1,000
<i>NEONATAL DEATH RATE</i>	=	$\frac{\text{deaths under 28 days of age}}{\text{total live births}}$	X	1,000
<i>POSTNEONATAL DEATH RATE</i>	=	$\frac{\text{total deaths from 28 days to 1 year}}{\text{total live births}}$	X	1,000
<i>IMMATURITY DEATH RATE</i>	=	$\frac{\text{total deaths from immaturity}}{\text{total live births}}$	X	1,000
<i>FETAL DEATH RATE</i>	=	$\frac{\text{total fetal deaths}}{\text{total live births}}$	X	1,000
<i>MATERNAL DEATH RATIO</i>	=	$\frac{\text{total maternal deaths}}{\text{total live births}}$	X	10,000

<i>GENERAL FERTILITY RATE</i>	= $\frac{\text{total live births}}{\text{total females, ages 15-44}}$	X 1,000
<i>AGE-SPECIFIC FERTILITY RATE</i>	= $\frac{\text{births specific to an age group}}{\text{females specific to an age group}}$	X 1,000
<i>TOTAL FERTILITY RATE</i>	= $5 \left(\sum_{a=15-19}^{a=40-44} \text{age-specific fertility rate} \right)$	
<i>MARRIAGE RATE</i>	= $\frac{\text{total marriages}}{\text{total population}}$	X 1,000
<i>DIVORCE AND ANNULMENT RATE</i>	= $\frac{\text{total divorces and annulments}}{\text{total population}}$	X 1,000

ADDITIONAL INFORMATION

The information found in the tables and figures in this volume is tabulated for Georgia residents by county of usual residence except for the marriage and divorce data. Marriages are tabulated by county of application and divorces by county in which decree was granted.

SYMBOLS USED IN THIS REPORT

- Quantity is zero in frequency table
- Data not available
- ... Rate or percent not applicable
- 0.0 Rate or percent more than zero but less than 0.05
- 0 Quantity is zero in rate table

By no means is this published report exhaustive. The basic premise of this volume is to present information that is most often requested and that is most often needed by health planners. Additionally, many comparisons of data are made with national indicators. However, if further data is necessitated, please contact:

POPULATION TRENDS

SECTION II

POPULATION TRENDS

POPULATION DYNAMICS

The dynamics of population change are governed by three major events: births, deaths, and migration. Of the three, deaths are the most predictable, while births and migration are more difficult to evaluate continually in a population-forecasting methodology.

Figure 2 portrays the effects of various fertility assumptions on the Georgia population. Notably, in 1970 our total fertility rate was 2.6, and this would produce approximately 6.8 million people in Georgia by the year 2000; and about 8.6 million people in the year 2020. This projection also accounts for death and migration variations. Utilizing the projection methodology that gives the results shown in Figure 2, we produced projected population by age, sex, and race for Georgia in 1973 (Table 1).

The variability of births is demonstrated by Figure 3. Beginning in 1945, we see the impact of the post World War II baby boom; likewise, the rate of natural increase shows significant gain during the same time period: 1945-1950. Since 1954, we have seen a steady decline in the birth rate. The 1954 rate was 27.3, while the 1973 rate was 17.8. It is apparent that the trend of the natural increase rate parallels the birth rate trend.

The death rate in Georgia for the past 28 years (1945-1973) has shown no significant change. In 1945, it was 8.3; by 1973, it had increased to

ANNUAL RATES OF NATURAL INCREASE, BIRTHS, AND DEATHS: GEORGIA, 1945 to 1973

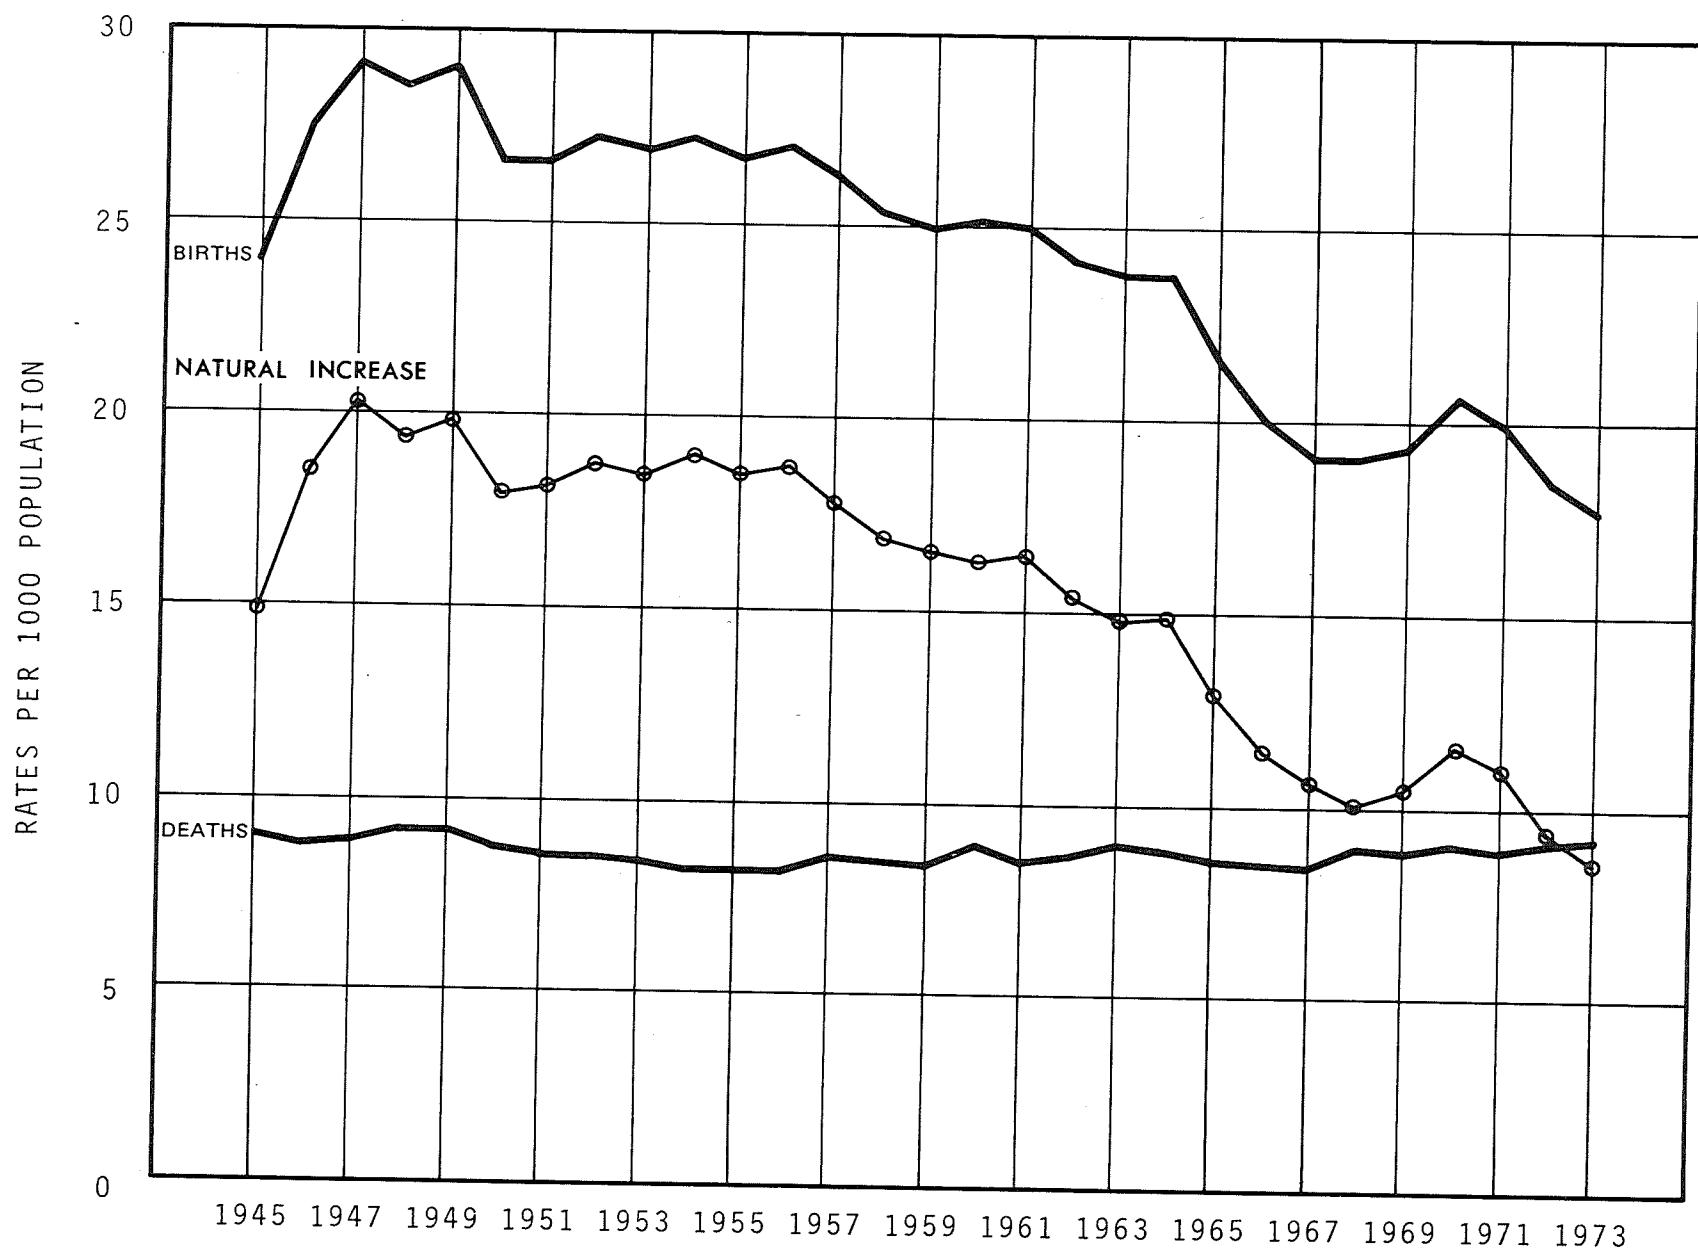

Figure 3

GENERAL FERTILITY RATES BY RACE: GEORGIA, 1960 to 1973

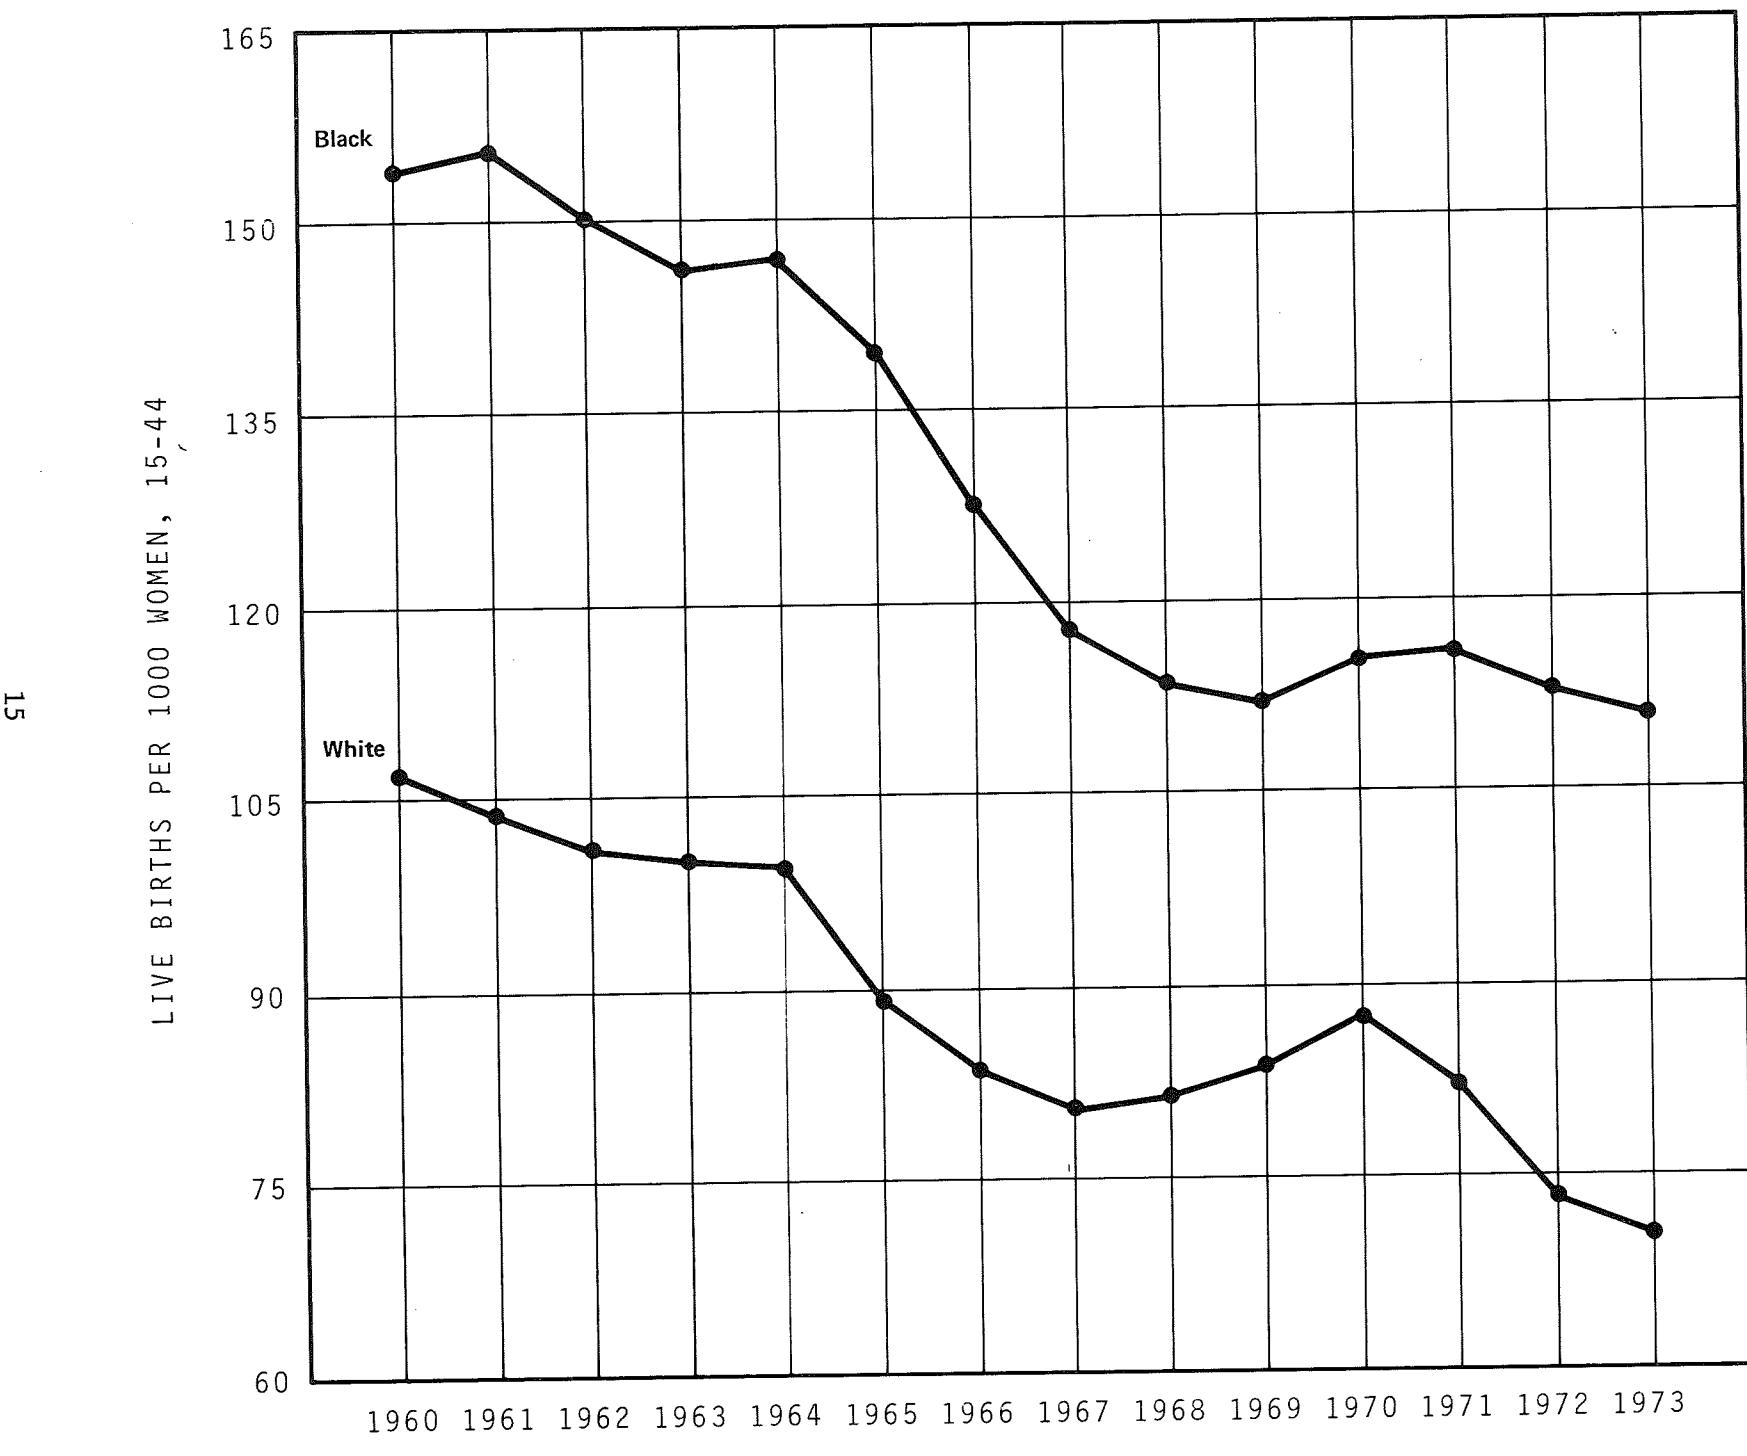

Figure 4

9.2. Without major changes in our personalized life strategy relative to health and without new emphasis on environmental and human biology components of health, there is little indication that major changes will occur in the overall death rate. Consequently, there may be a need for a new perspective for health programs to effect a better quality of health in Georgia.

General fertility rates have shown a major decline in the past 13 years (Figure 4). The rates for the black and the white populations have had parallel decreases since 1960. The rates in 1960 were 153.8 and 107.0 for the black and the white populations, respectively. The respective rates declined to 111.0 and 70.6 by 1973. This component of population change is of considerable importance to the planning and evaluation of health programs.

POPULATION PATTERNS

It is essential to realize that population patterns will change geographically and temporally. As discussed in the preceding notes, population growth is a highly dynamic phenomenon, dependent upon births, deaths, and migration. Over a period of several years, we see that in Georgia there are significant changes in the geographic and age distribution of the population.

Figures 5 through 9 show the changes in the age, sex, and race distribution of the Georgia population for an encompassing time period of 40 years. These pictorial diagrams are called age, sex, and race pyramids. They provide a static frame for each time period of investigation and show the percent of total population that is occupied by specific five-year age groups, race, and sex.

POPULATION BY RACE, SEX, AND AGE GROUP: 1940

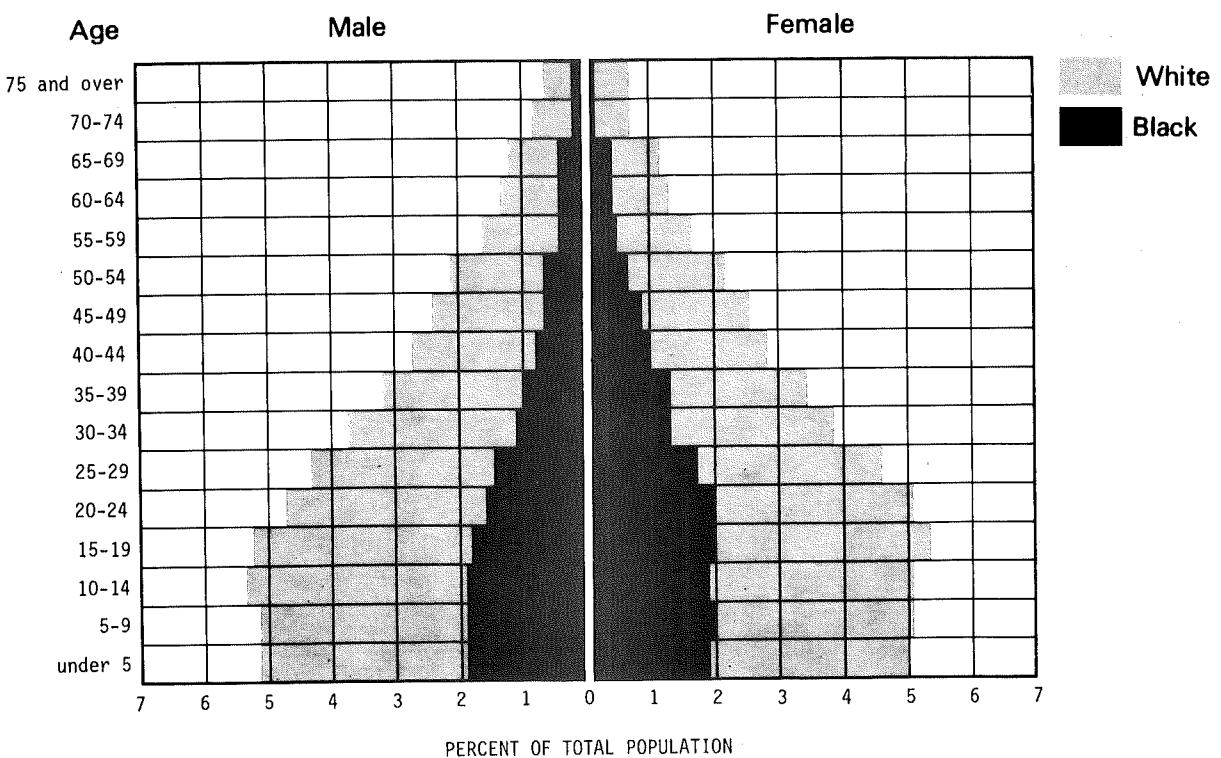

Figure 5

POPULATION BY RACE, SEX, AND AGE GROUP: 1950

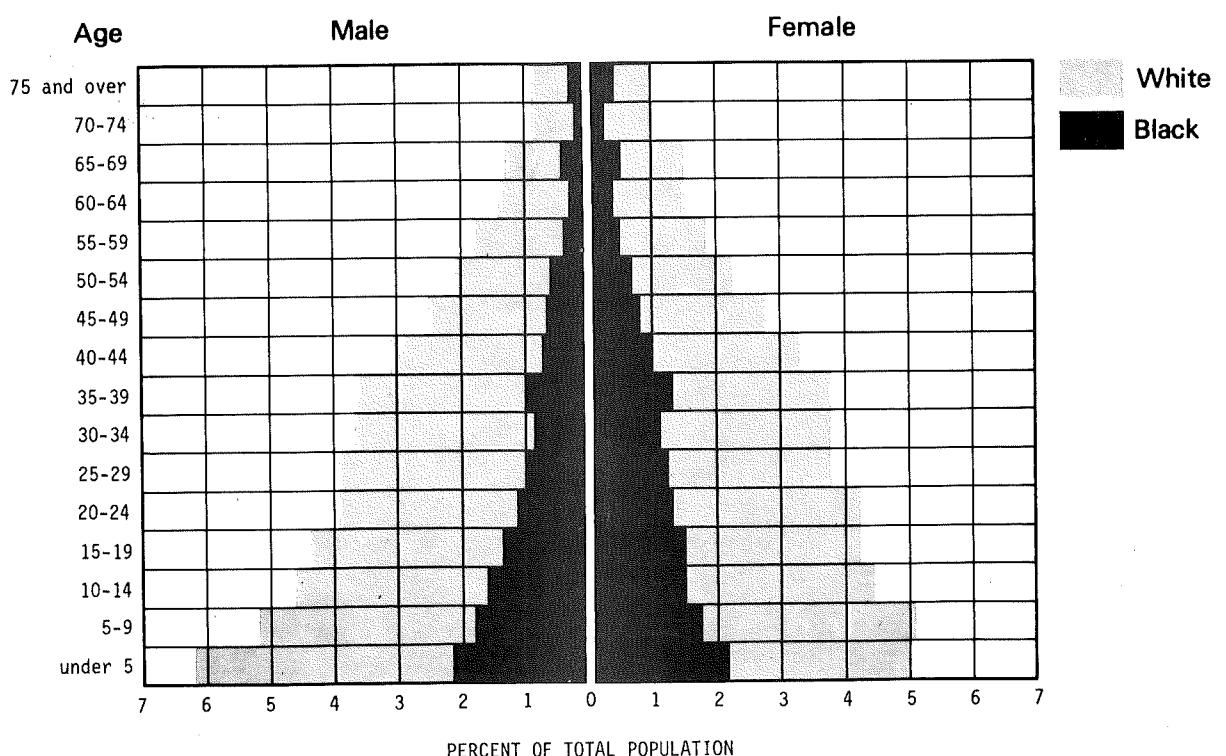

Figure 6

POPULATION BY RACE, SEX, AND AGE GROUP: 1960

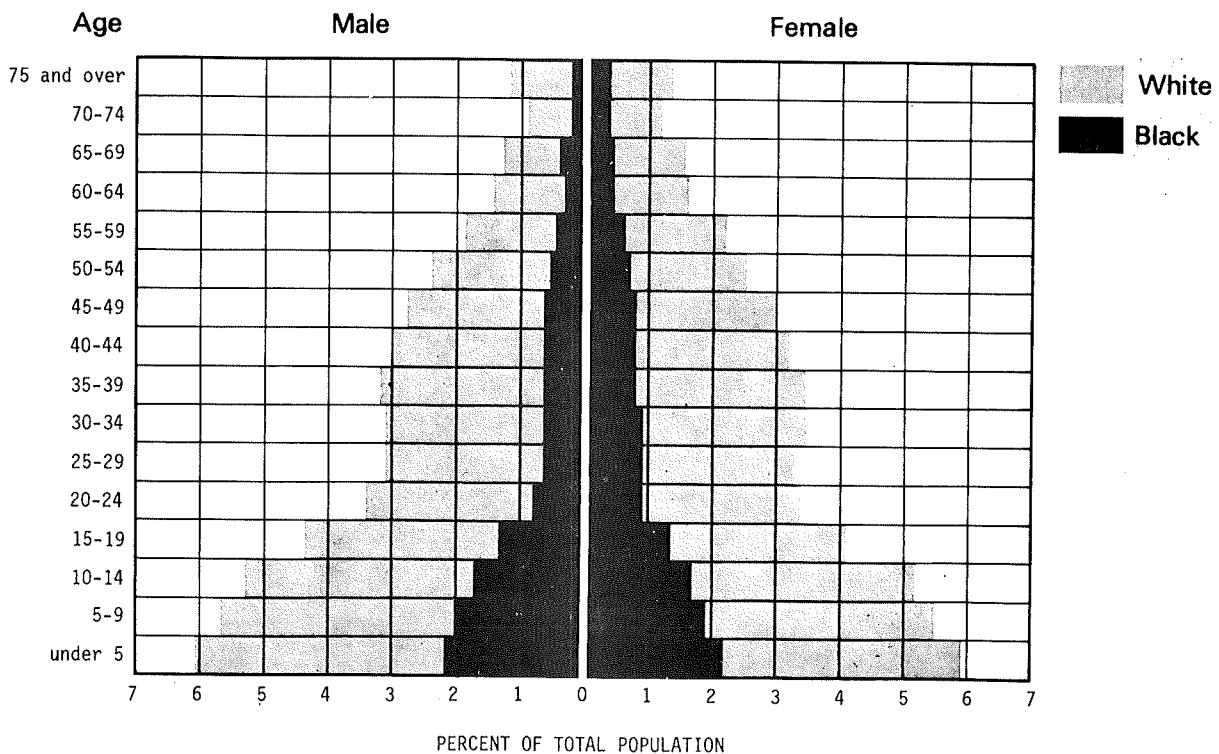

Figure 7

POPULATION BY RACE, SEX, AND AGE GROUP: 1970

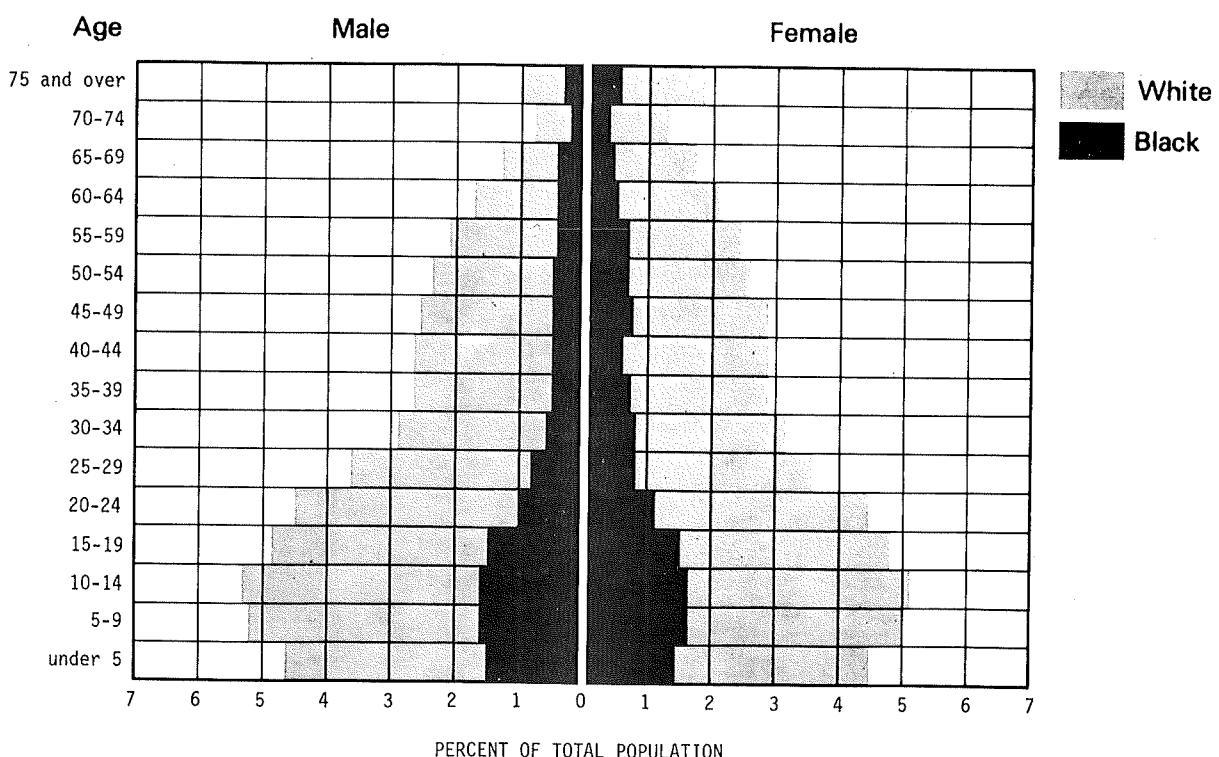

Figure 8

POPULATION BY RACE, SEX, AND AGE GROUP 1980

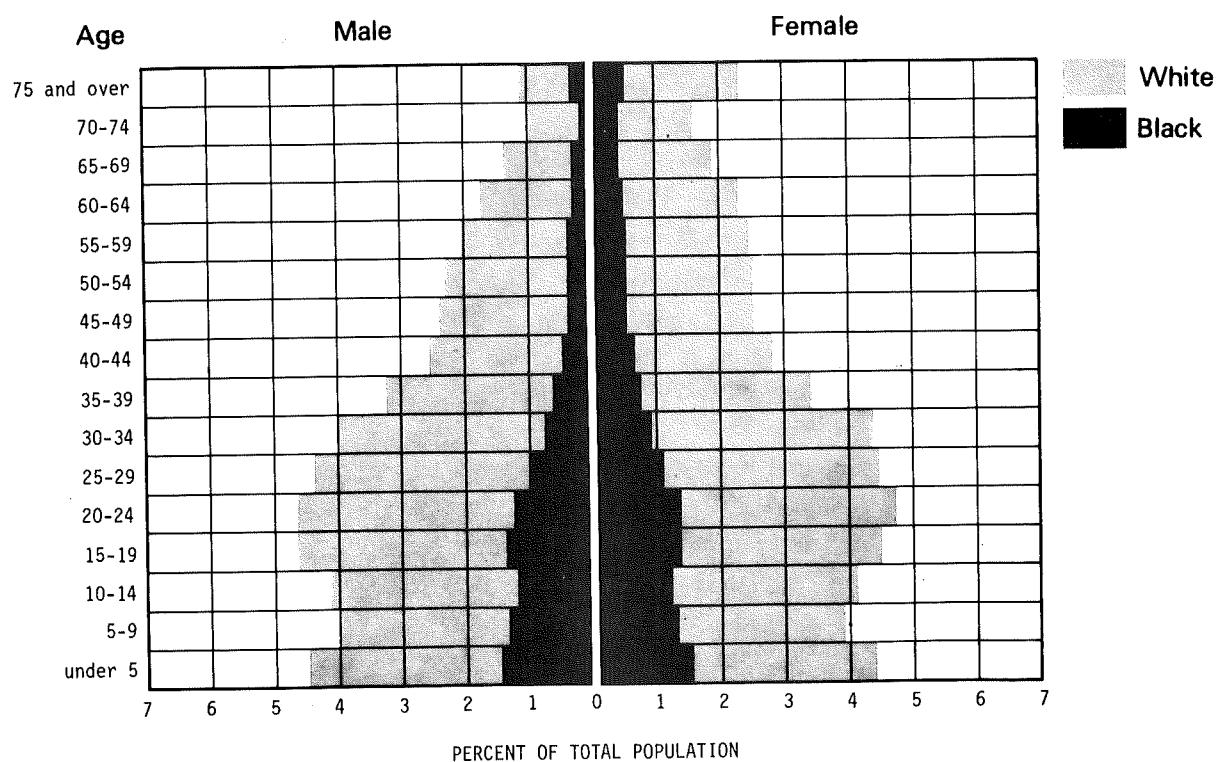

Figure 9

The 1940 pyramid shows a narrow base, indicating the younger age groups are in a minority when compared to the 10-14 and to the 15-19 age groups. However, this peculiarity is overshadowed by the symmetry portrayed above these age groups.

The 1950 pyramid gives the first evidence of the post World War II baby boom. In 1940, about 10.1% of the population was 0-4, while 1950 shows a percentage of about 11.2. In addition, the symmetry noted in 1940 tends to disappear in 1950. The continuing effects of the baby boom are also apparent in the 1960 pyramid (Figure 7). In fact, the 0-4 age group occupies about 12% of the total population. Of further interest is the concave appearance of the 1960 graph for ages 20-24, 25-29, and 30-34. These are the particular age groups of the pre-baby-boom period.

The 1970 graph begins to show three interesting trends. First, the post World War II baby-boom period is over, as shown by the 0-4 age group which occupies only about 8.9 percent of the total population. Second, the impact of the baby boom has moved on to the upper age groups, making various impacts on education, crime, and housing. Third, the pre-baby-boom is reflected in the box appearance of the upper portions of the graph. The 1980 pyramid shows the forward movement of all age groups that have survived the depression era (beginning in 1929); the post World War II baby boom (1945-1950); and the reduced fertility and recession period of the '70s.

In addition to the age distribution of the Georgia population, we must examine the geographic distribution in order to pursue effective health programming. Figure 10 clearly shows the major population areas in the State of Georgia. The map is a three-dimensional diagram which shows variations in the magnitude of the population data extremely well. This

TOTAL PROJECTED POPULATION 1973

21

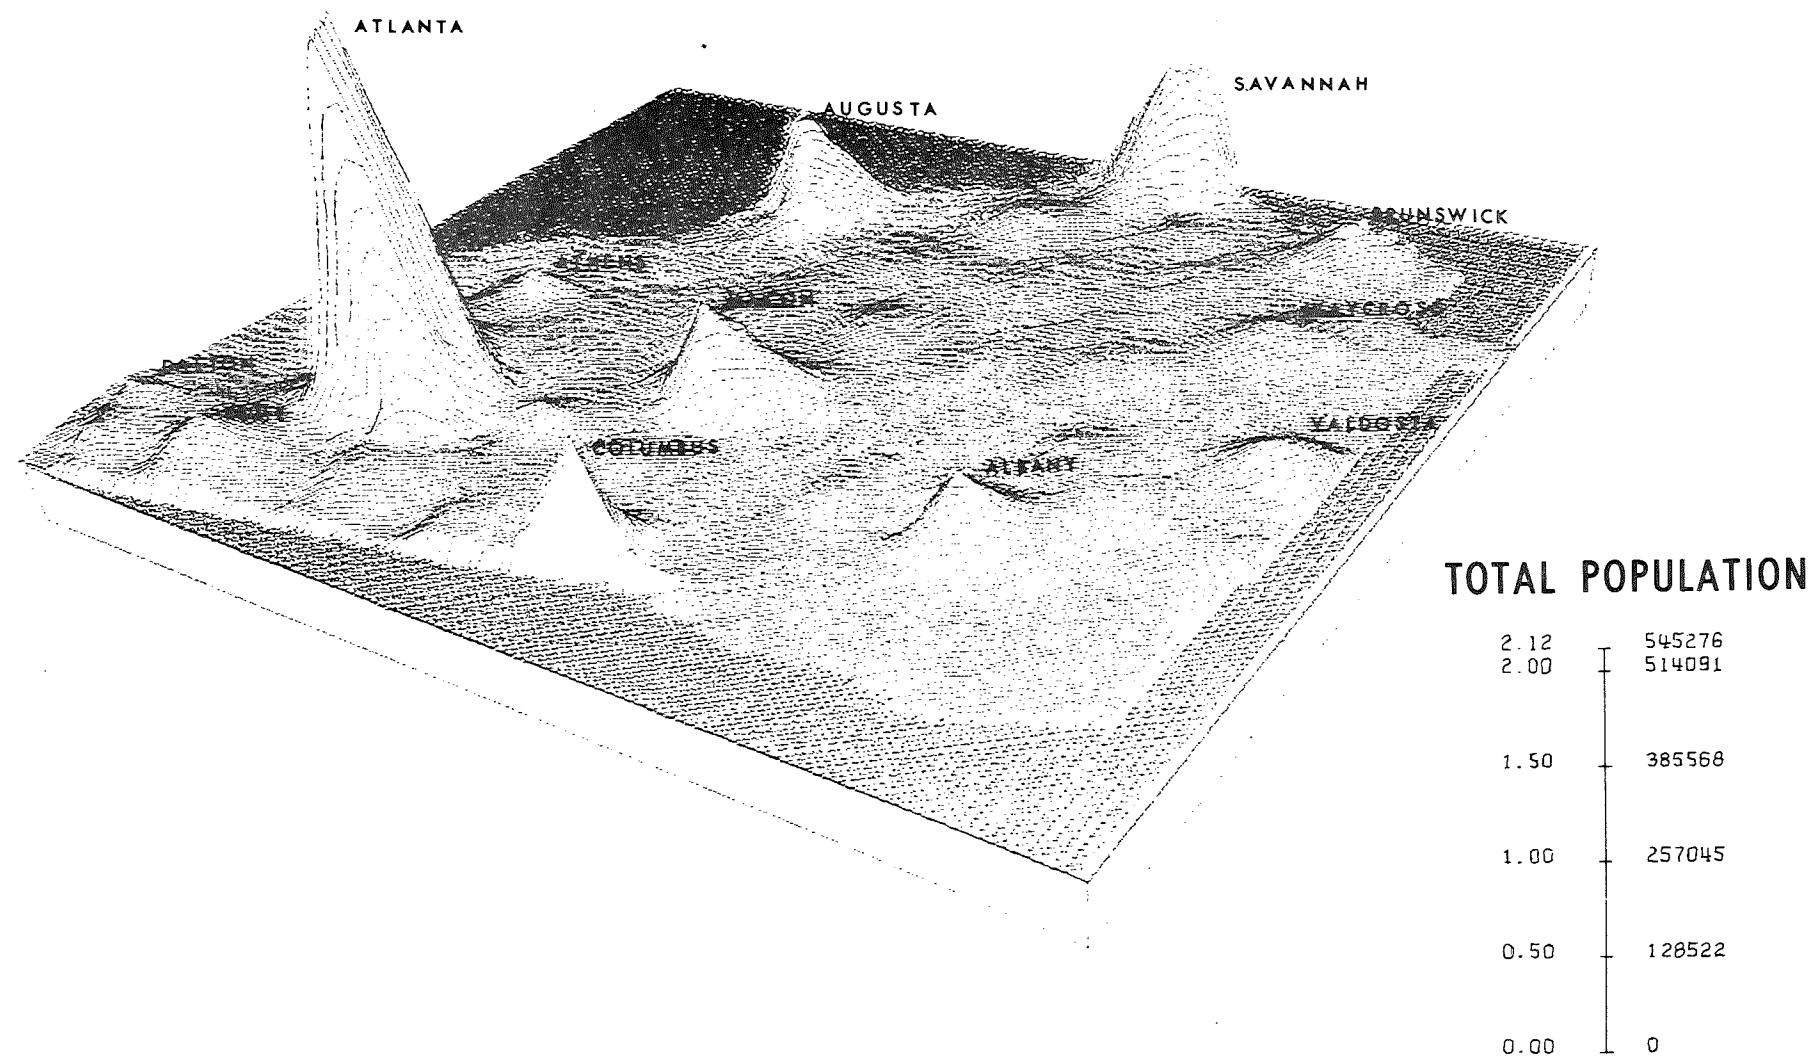

Figure 10

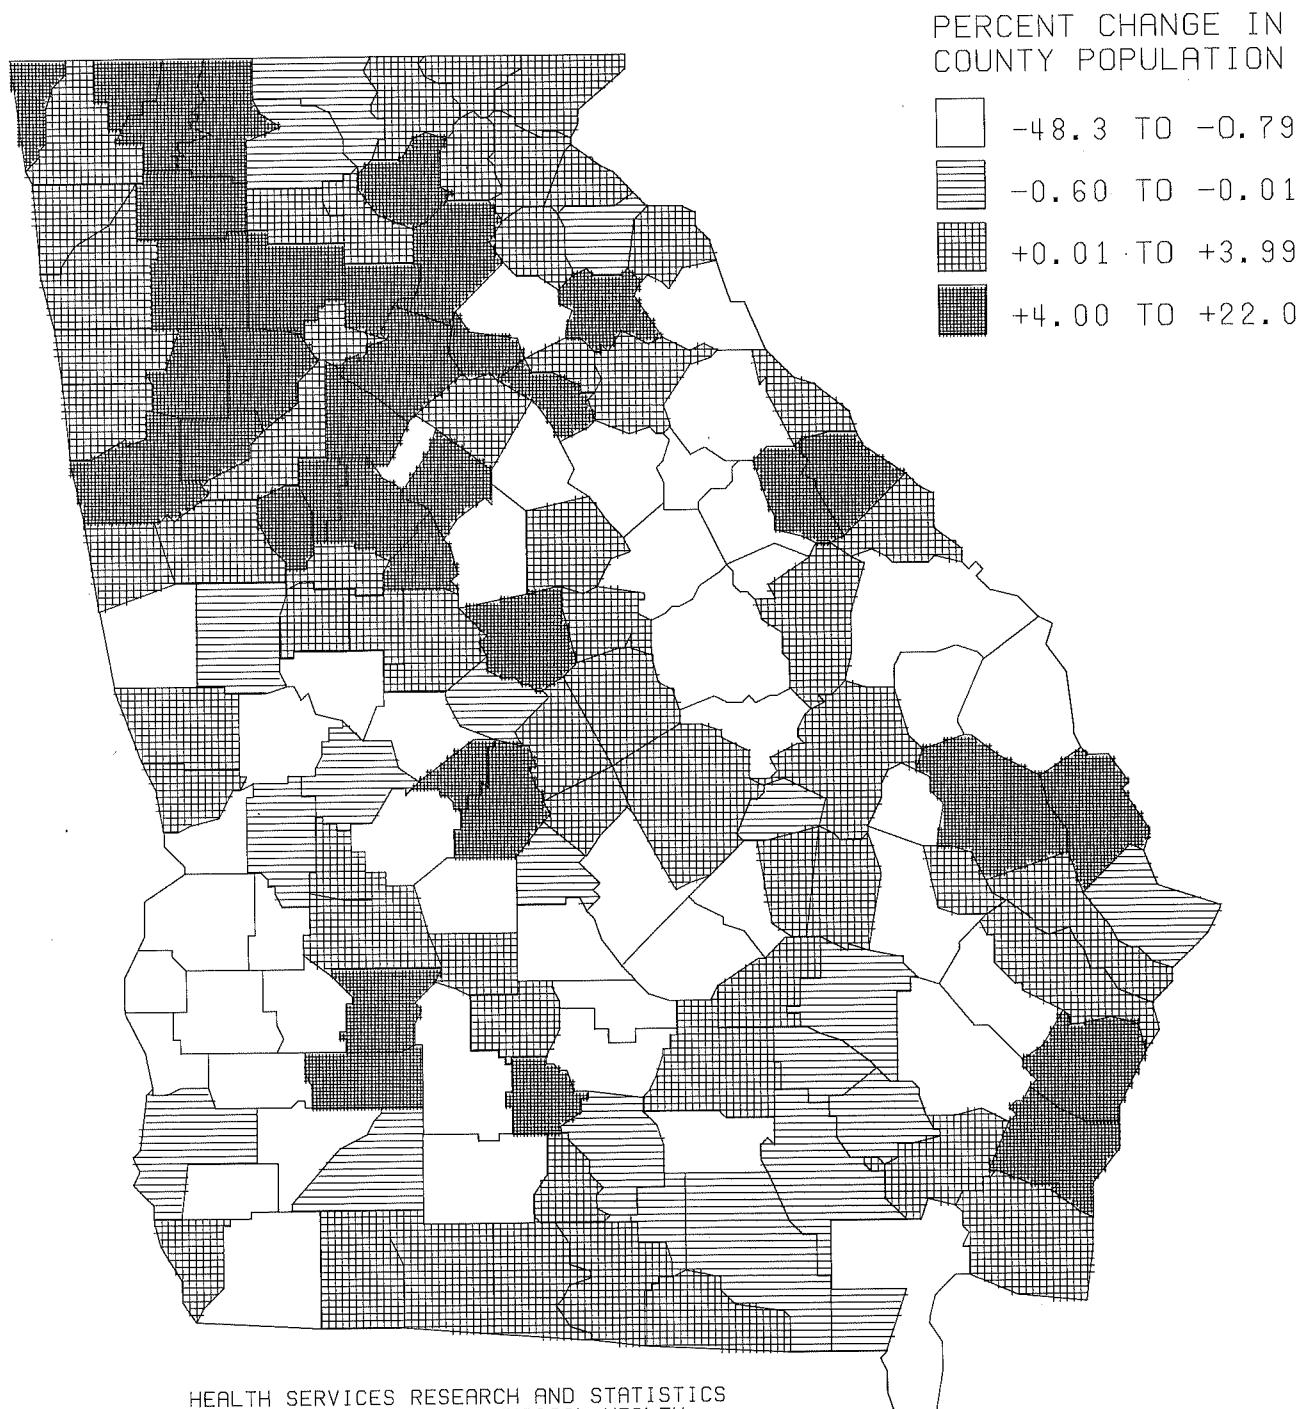

technique allows one to make relative comparisons of the population centers to other areas within the state.

A change in the geographic distribution of a population occurs either by migration or by a natural increase or decrease. Over the past three decades, Georgia has lost population from the central portion of the state. Gains in population from 1940 to 1970 have occurred in the Atlanta Metropolitan Area, the North Georgia area, and the coastal area, excluding Chatham County for 1970 where a slight loss occurred.¹ The percent change in population for the period of 1970 to 1973 follows trends that were demonstrated during the period 1940-1970 (Figure 11). Specifically, a cluster of counties surrounding the Atlanta region shows increases up to 22%. However, Fulton County, although showing slight gains, will probably show some decline by the end of 1980. The coastal region shows continued increases, with only Chatham County showing a loss. The losses in Chatham County appear to be gains for the adjacent counties. These losses or slight gains appear to be following the national trend, where the metropolitan growth rate is slower than the non-metropolitan rate. The central portions of the state demonstrate a loss for the same period and reflect a continuation of the trend exhibited from 1940 to 1970.

A cursory review of the percent change in population (1970-73) by age and race reveals an interesting profile for the state (Figure 12). The total population for all ages and both races has increased by more than 6%. In the white population groups, percent negative changes are shown for the < 1 and the 5-14 ages, while substantial positive changes have occurred in

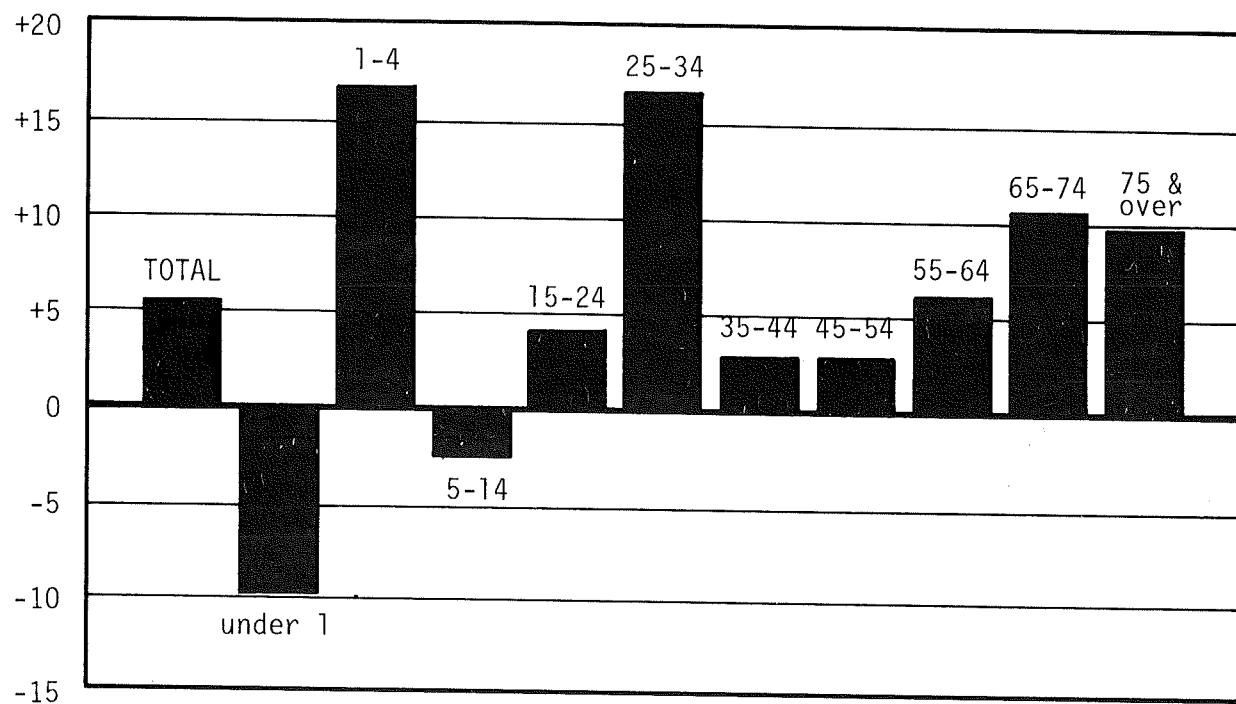

¹ U. S. Bureau of the Census: U. S. Census of Population: 1970 Number of Inhabitants, Final Report PC(1)-A1, United States Summary, Figure 29, Population Trends by Counties, 1940 to 1970, p. 28.

PERCENT CHANGE IN POPULATION, 1970-1973

PERCENT CHANGE IN POPULATION BY RACE OF SELECTED AGE GROUPS: GEORGIA, 1970 to 1973

WHITE

BLACK

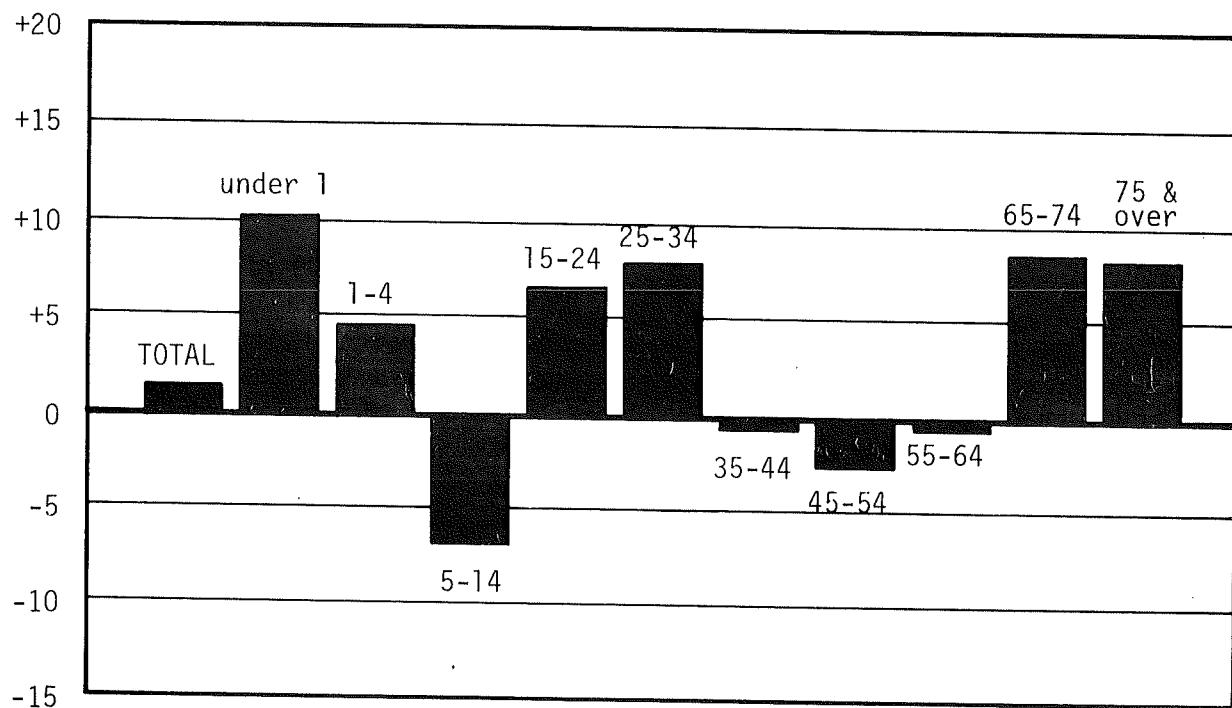

Figure 12

the 1-4 and the 25-34 age groups. The black population shows negative changes in four age groups: 5-14; 35-44; 45-54; and 55-64. Positive changes of interest for the black population are reflected in the < 1 and the 25-34 age groups. These changes must be accounted for in the planning and development of state programs.

TRENDS OF LIFE OCCURRENCES

SECTION III

TRENDS OF LIFE OCCURRENCES

To develop a personalized health life strategy, we must understand the trends of life occurrences. Recent interest has surfaced relative to the understanding of health status through the use of descriptive indicators. Table 2 illustrates trends for several descriptive indicators of health status which show limited changes over the past two decades. In order to have a positive impact on these indicators (excluding infant mortality), a change is necessitated. We must "shift gears" with our health programs and lead into a presumptive state that allows creative programming. If we are able to be analytical in our approach to change and to discard various myths about disease patterns, then reductions may occur in death and disability. However, present circumstances have led to increases in our disease rates. For instance, heart disease, cancer, stroke, accidents, motor vehicle accidents, diabetes mellitus, and cirrhosis of the liver have shown various rates of increase. On the other hand, birth and infant mortality rates have shown substantial declines. Minimal changes have occurred in the total death rate and the average life expectancy at birth. These trends are evident for Georgia and the United States for the past 23 years (Table 2).

BIRTHS

Birth rates have shown a steady decline since 1945 for the white and black population (Figure 13). The respective rates of decline for the

TABLE 2
SELECTED INDICATORS OF HEALTH STATUS, GEORGIA AND THE UNITED STATES, 1950, 1960, 1970, AND 1973

Health Status Indicator	Georgia				United States			
	1950	1960	1970	1973	1950	1960	1970	1973
Live birth rate (per 1,000 population)	26.7	25.2	20.7	17.8	24.1	23.7	18.4	14.9
Death rate (per 1,000 population)	8.8	8.9	9.1	9.2	9.6	9.5	9.5	9.4
Infant mortality rate (per 1,000 live births)	33.5	32.9	22.4	19.2	29.2	26.0	20.0	18.1
Average life expectancy at birth, in years	65.8	67.9	68.7	NA	68.2	69.7	70.9	71.3
Leading causes of death (per 100,000 population):								
Diseases of the heart	267.5	288.6	308.1	311.0	355.5	369.0	362.0	360.8
Cerebrovascular	118.6	138.7	121.9	122.9	104.0	108.0	101.9	102.1
Cancer	96.7	110.5	129.3	136.1	139.8	149.2	162.8	167.3
All other accidents	35.4	34.5	33.6	34.5	37.5	31.0	29.5	28.7
Motor vehicle accidents	26.1	25.8	38.9	38.5	23.1	21.3	26.9	26.5

LIVE BIRTH RATES BY RACE: GEORGIA, 1945 to 1973

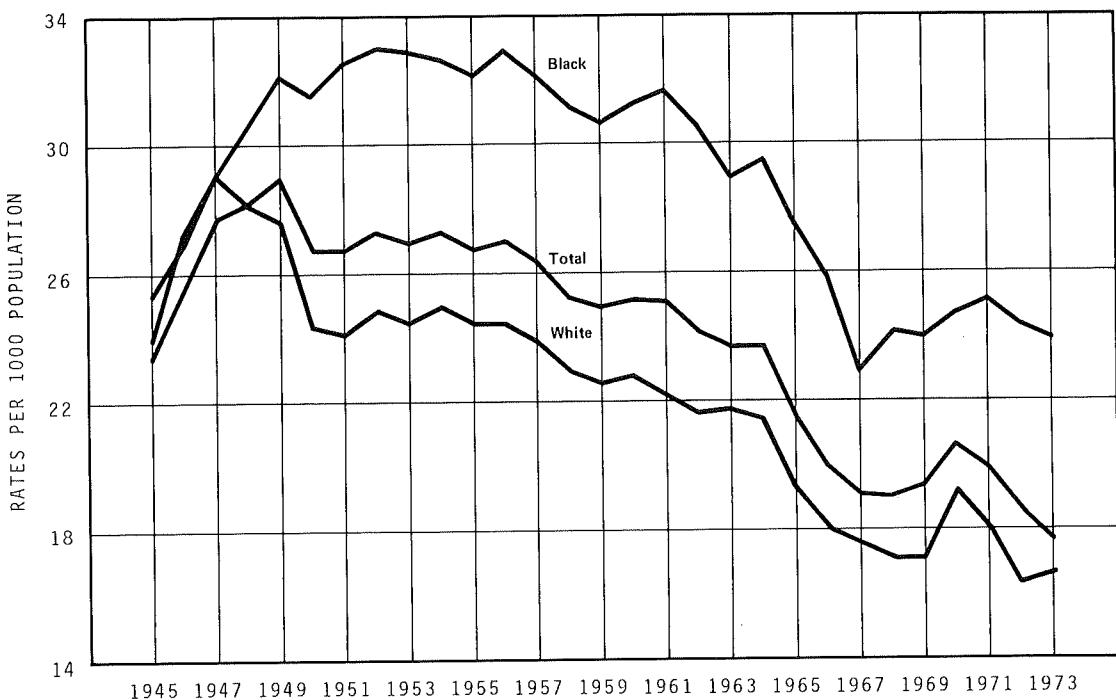

Figure 13

IMMATURE BIRTH RATES BY RACE: GEORGIA, 1950 to 1973

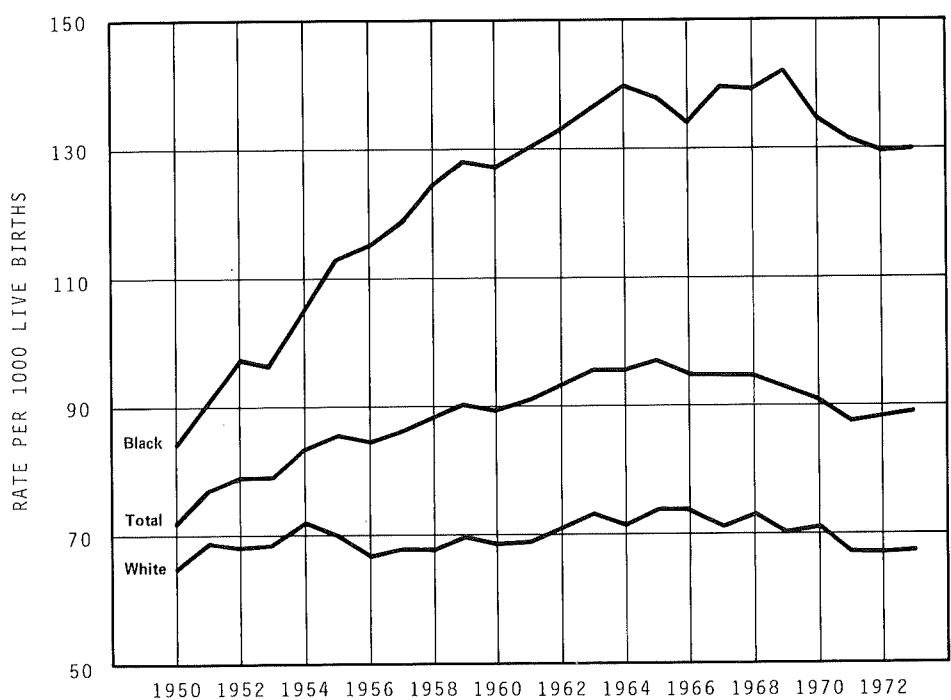

Figure 14

period 1954 to 1973 for the white and black population groups are 25.0 to 15.6 and from 32.7 to 24.0 (Table 3). During the same period, the birth rate for the United States declined from 24.9 to 15.0 (Table 4).

The rate of immaturity at birth is presented by Figure 14. Of the 100,191 births in 1954, 8,382 were immature--or about 8.4%. The percentage of white immature births was 7.2, while for the black population it was 10.5% (Table 3).

In 1973, Georgia experienced 85,285 births. Of this number, 7,582 were immature. This represents, respectively, percentages of 6.7 and 13.0 for the white and black population groups.

The immaturity rate for the black population has steadily increased, but since 1969 we have seen a slight decrease. In contrast, the white immaturity rate has remained relatively constant for the past 23 years--65.0 to 67.4 (1950-1973). The rates of immaturity may be used as an evaluative measure for programs directed toward the medically indigent, high-risk mothers and their newborn.

Deaths due to immaturity have shown significant decline (Table 3). In 1954, the total death rate due to immaturity was 6.2 per 1,000 live births but has declined to 1.5 in 1973. This obviously represents a substantial improvement in the health care of infants.

FETAL DEATHS

The reflected trends for this life occurrence have undergone considerable and significant change (Figure 15). Three events have had an impact on the occurrence of fetal deaths. First, prior to 1954 only fetal

FETAL DEATH RATES BY RACE: GEORGIA, 1950 to 1973

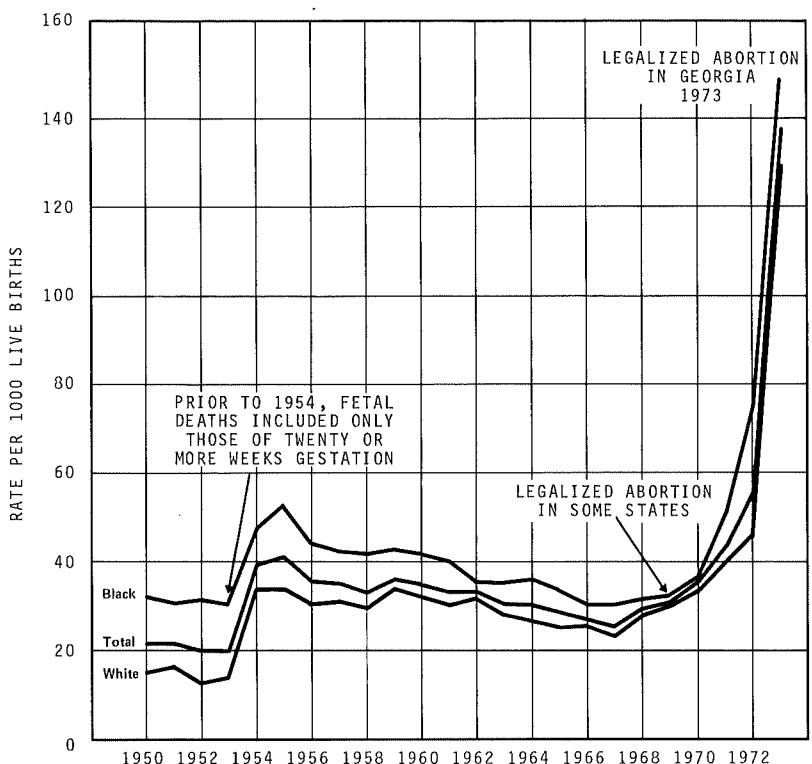

Figure 15

INFANT MORTALITY RATES BY RACE: GEORGIA, 1950 to 1973

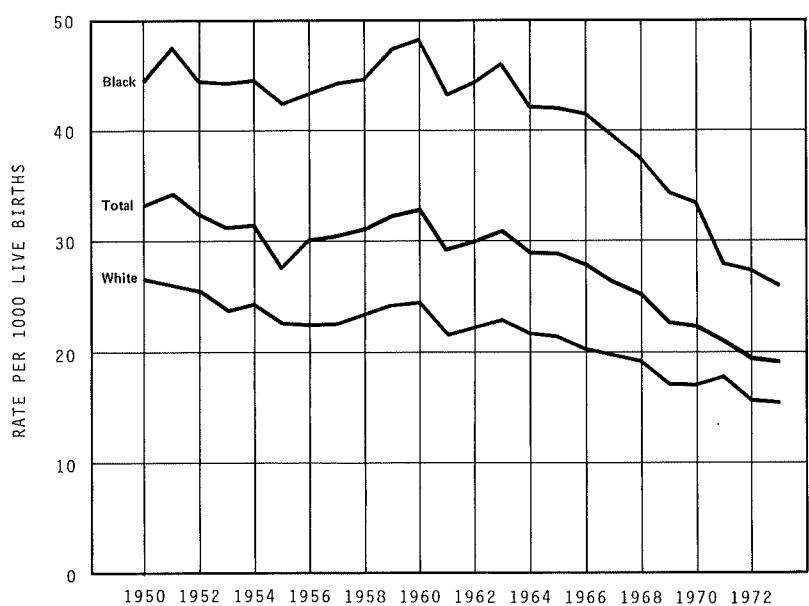

Figure 16

deaths of 20 weeks' gestation or greater were reported. Thus, the graph shows a modest increase for the year 1954. From 1954 to 1969, we see a slow rate of decline. Second, in 1969 abortion became legal; thus, there is a slight increase in the fetal death rate. Third, in 1973 the liberalized abortion law was instituted. This produced an increase of tremendous magnitude. One must remember that abortions are included in the calculation of the fetal death rate.

INFANT AND MATERNAL DEATHS

The traditional measure of health status--infant mortality--has shown continual decline in Georgia (Figure 16). This conclusion also applies to the neonatal and maternal death rates for the white and black populations (Figures 17 and 18). Infant mortality declined from 31.5 in 1954 to 19.2 in 1973, while neonatal mortality declined from 21.0 to 12.9 during the same time period (Table 3). In comparison, the United States rates of change for these two events show similar decreases (Table 4).

In Georgia, maternal death rates have declined from 10.9 in 1954 to 2.0 in 1973, while the United States' rate shows a corresponding decrease of 5.2 to 1.5 (Tables 3 and 4).

The trends for these three life occurrences (infant, neonatal, and maternal deaths) are optimistic; with limited resources, it would be hoped that continued declines occur. However, the challenge of reducing these rates in the future is one that must be faced with considerable endeavor.

MORTALITY

Reduction in total mortality in Georgia has shown oscillations but no

NEONATAL DEATH RATES BY RACE: GEORGIA, 1950 to 1973

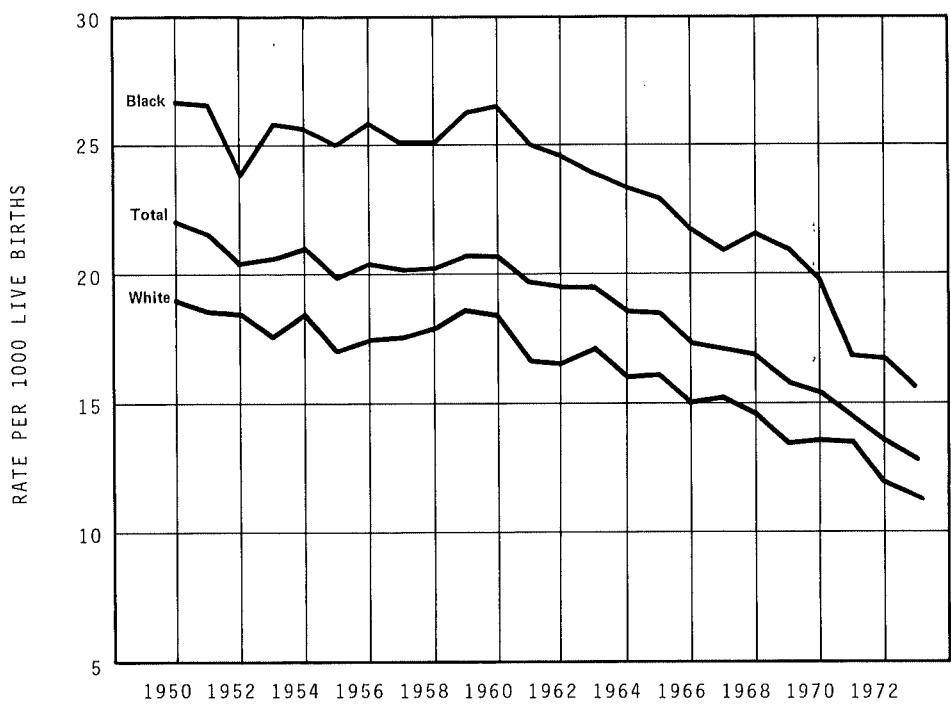

Figure 17

DEATH RATES FROM ALL CAUSES BY RACE: GEORGIA, 1945 to 1973
 (Excluding Fetal Deaths)

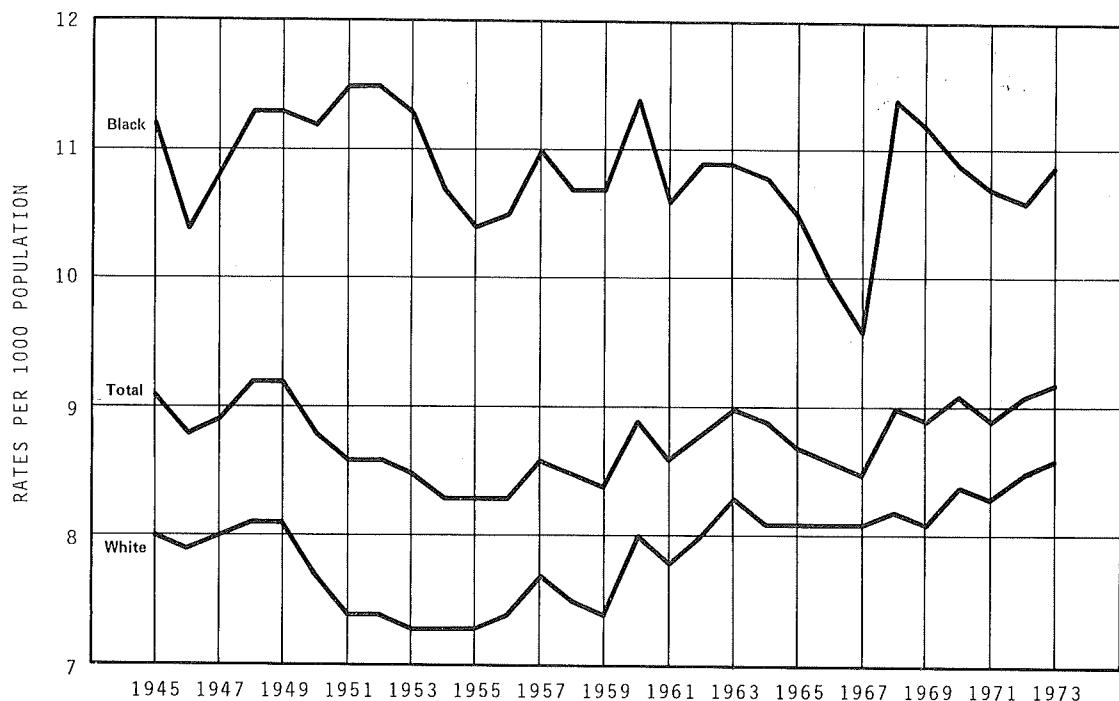

Figure 19

MARRIAGE RATES BY RACE: GEORGIA, 1953 to 1973

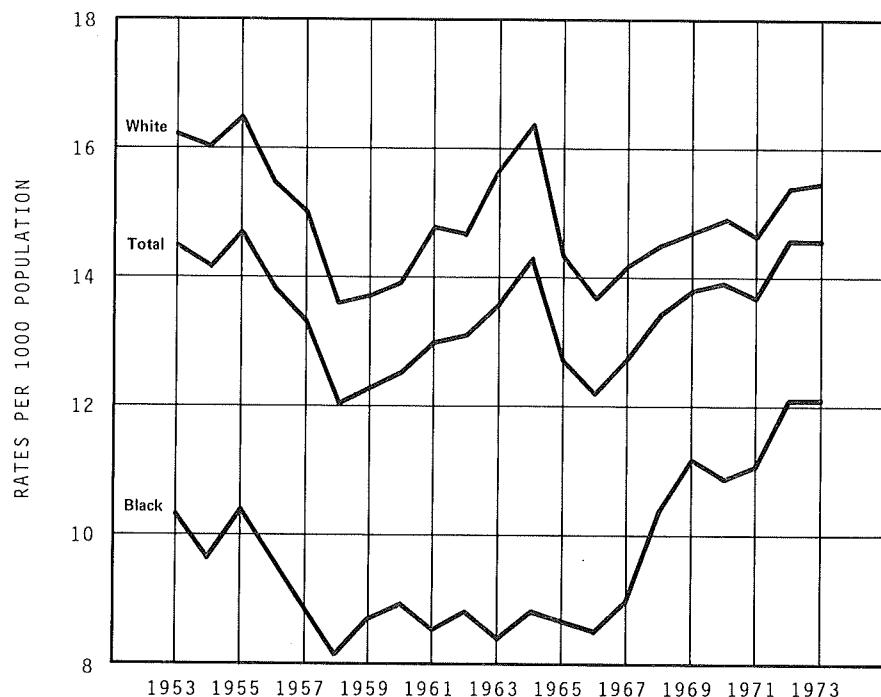

Figure 20

overall trend has emerged (Figure 19). For instance, in 1945 the rate was about 9.1, while in 1973 it was 9.2 (Table 3). Decomposition of mortality by race reveals the following differences: black rates changed from 10.7 to 10.9, white rates changed from 7.3 to 8.6 (Table 3). Thus, both rates showed moderate increases. Nationally, a trend is not evident. From 1954 to 1973, the rate changed by .2 (Table 4). As mentioned previously in the section on population trends, death rates show little variability and therefore become the stable component of the population forecasting model.

MARRIAGE AND DIVORCE

The final events of life occurrence to be discussed--marriage and divorce--has been subjected to much controversy. In an era of rapid change, the institution of marriage is taking different forms and providing increases in the rate of divorce. For the past 20 years, the trends for marriage show various stages of incline and decline. A steady downward trend occurred from 1953 to 1958, an upswing from 1958 to 1964, followed by a slight decline to 1966, then an increase to 1973 (Figure 20).

The U. S. trends for marriage have shown a gradual but steady increase. In addition, the divorce rate has essentially doubled since 1954 (Table 4).

SUMMARY

Trends in life occurrences will be of considerable utility in creative health programming. Comparing the trends of the different life occurrences will provide an overview of the dynamics of their interrelationships. Moreover, the comparison data for the U. S. and Georgia allow one to put in perspective the various vital events as they pertain to Georgia. In a

sense, it provides a goal for Georgia health programs to pursue. Further, one may calculate the percentage change from year to year and project the future rates. Too, one may calculate the average for the period of time presented and determine the amount of variation of a rate. This process would allow program objectives to be stated with high and low levels of acceptance. Finally, the only limiting use of this data is one's imagination.

BIRTHS

SECTION IV

BIRTHS

In the previous section on trends of life occurrences, we gave an overview of the last 20 years of birth experiences in Georgia and the United States. This section focuses more specifically on the events surrounding birth patterns in Georgia for the current year.

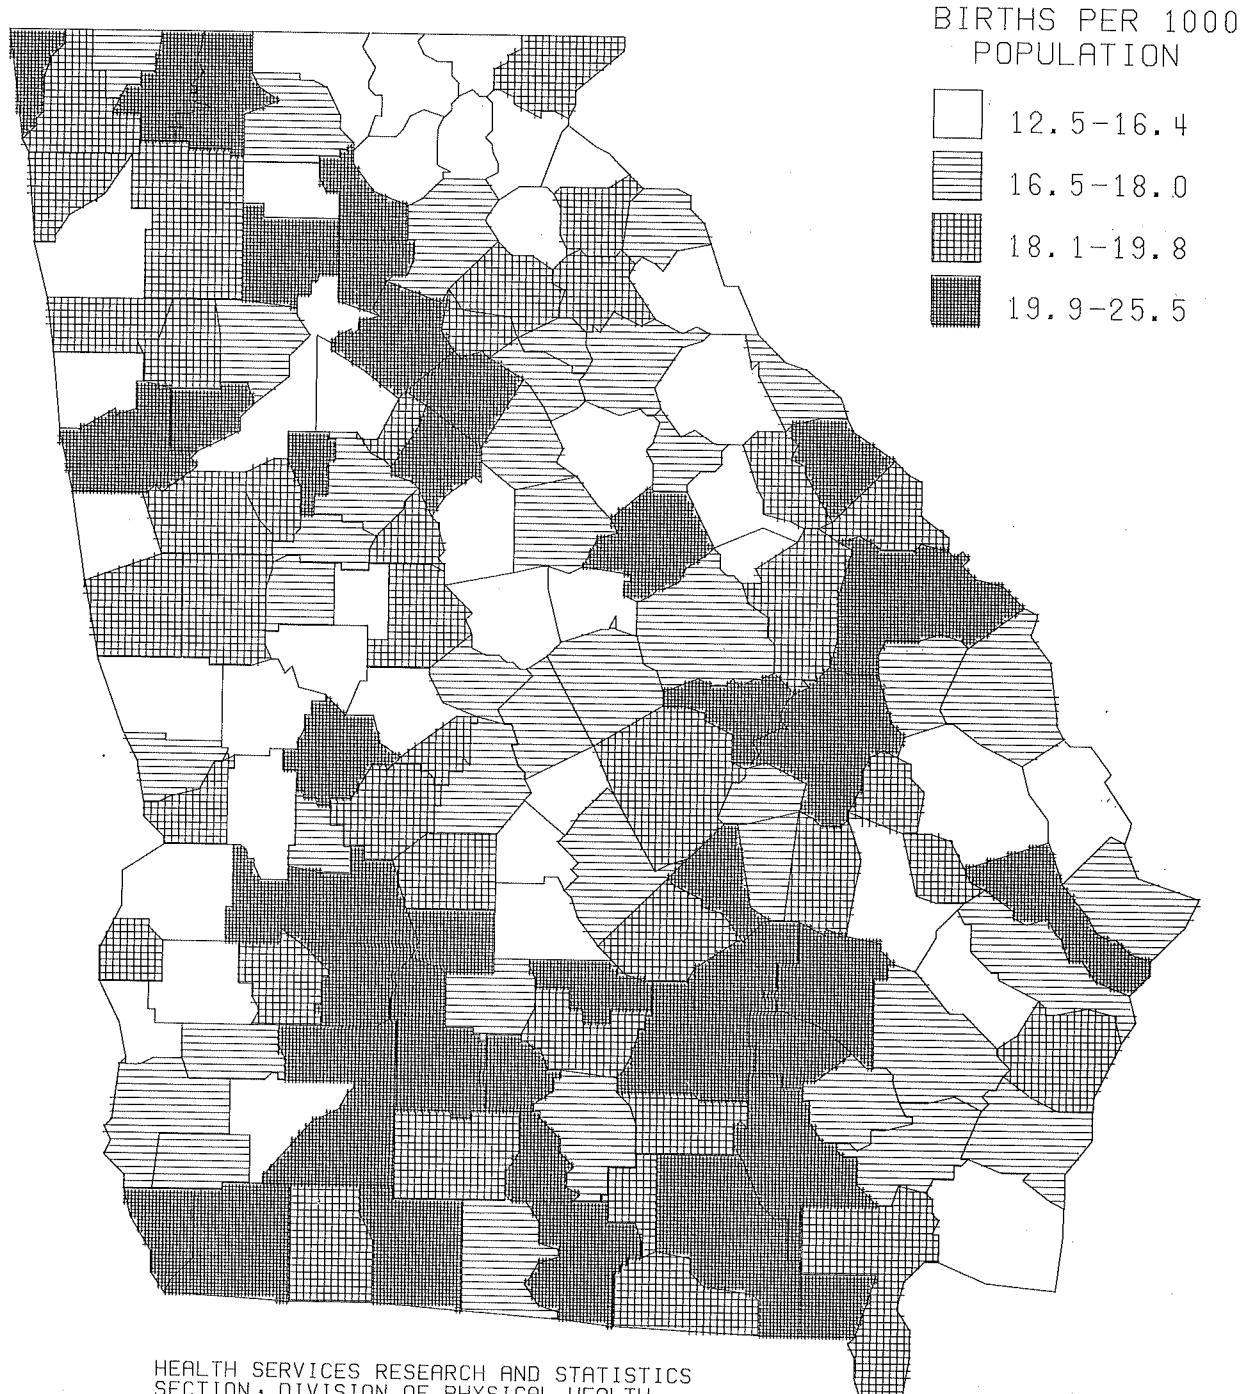

The spatial pattern of birth rates is demonstrated by Figure 21. The range is from 12.5 to 25.5 births per 1,000 population. There are several concentrations of high and low rates. The southwest and the south central portions of the state experience two high birth-rate areas. An obvious low birth-rate area is in north Georgia. Other high and low birth-rate areas appear to be distributed sporadically.

The total live births by race and month of occurrence show minimal variations (Figure 22). Three months for both races show moderate increases in births for 1973. Specifically, the peaks occur in January, March, and August.

Births by birth order, race, and age of mother are illustrated in Table 5. This year for the first time we have displayed a third category called "other." This allows one to make direct observations about the black population; in the past, they were included in the "other" category.

Most births for the white, black, and other population groups occurred in the 20-24 age group of mothers (Table 5). In reference to birth order, there were 25,999 mothers who gave birth to their first child, and this

LIVE BIRTHS, 1973

accounts for the highest rate of births per 1,000 females for both black and white groups. Thus, for the black the rate is 22.7, and for the white it is 16.4. A notable change for the two population groups is the rate for mothers of birth-order six and over. The black rate is 5.6, while the white rate is 1.0. Finally, those giving birth to their first baby by age of mother is significantly different. Black mothers predominantly in the 15-17 age group are giving birth to their first baby, while the white mothers are concentrating their first births in the 20-24 age group. However, when reduced to rates the concentrations occur in the 18-19 age group for both races.

Live births to unwed mothers by birth order, race, and age of the mother is portrayed in Table 6. The absolute numbers show concentrations in the 15 to 17 age group of the mother; and, what should be obvious, the majority of the births are first pregnancies. However, there are exceptions. For example, in the black population the unwed mothers in the 20-24 age group show a greater number of births occurring as the second birth.

SUMMARY

The tables and graphs in this section should provide valuable information to health planners in terms of identifying need groups in implementation of their programs. Only the highlights of the data have been noted, but surely a more in-depth analysis must be forthcoming for a meaningful and significant interpretation.

FETAL DEATHS

FETAL DEATHS

The section on trends of life occurrences gave a 20-year overview of fetal deaths. In particular, changing patterns of the law related to abortion have very much influenced the number of fetal deaths in Georgia.

The geographical distribution of fetal death rates in Georgia shows two distinct clusters (Figure 23): (1) the Atlanta Metropolitan Area and areas to the southwest; and (2) a linear pattern to the east of Atlanta, culminating in a minor cluster around Augusta. The entire southern portion of the state is a low-risk area in terms of fetal deaths. The rates range from 0.0 to 344.6 per 1,000 live births for 1973.

There were 11,758 fetal deaths in Georgia for 1973 (Table 7). Of these, 10,167 were under 20 weeks' gestation; 6,439 of these occurred in the white population, while 3,728 occurred in the black population. Thus, the respective fetal death rates are 129.7 and 153.5 (Table 3, Section III).

There is a definite seasonal variation in the occurrence of fetal deaths in Georgia (Figure 24). The peak months are August, September, and October. This trend may have value in determining the needs by month for the abortion clinics.

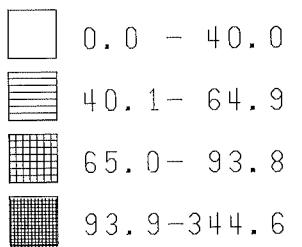

SUMMARY

Fetal deaths (including induced abortions) had an overwhelming increase for 1973. For instance, in 1972 we had only 4,928 fetal deaths

(Table 3, Section III). This trend of high fetal death occurrences must be reviewed very carefully so it may be incorporated into the planning process of the delivery of health care for family health programs.

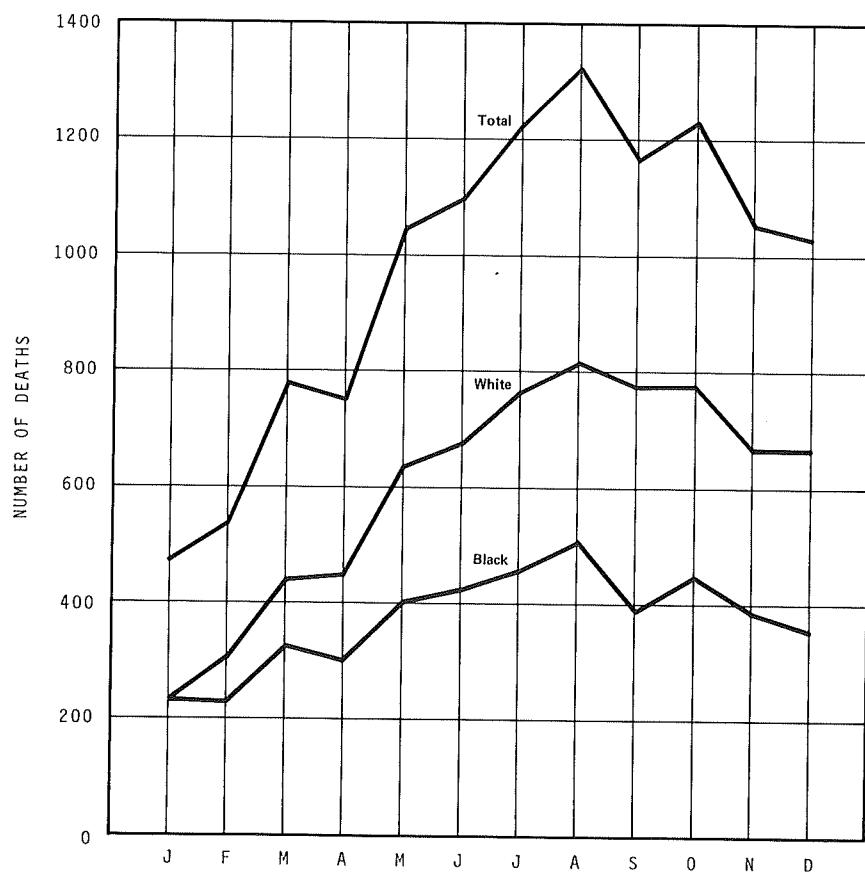

Figure 24

SECTION V

INFANT AND MATERNAL DEATHS

INFANT AND MATERNAL DEATHS

The 20-year trend for three selected events--infant, neonatal, and maternal deaths-- has declined significantly. However, as evidenced by our present high rates when compared to the U. S. rates, we still have a major course to pursue; i.e., to lower the infant and neonatal mortality.

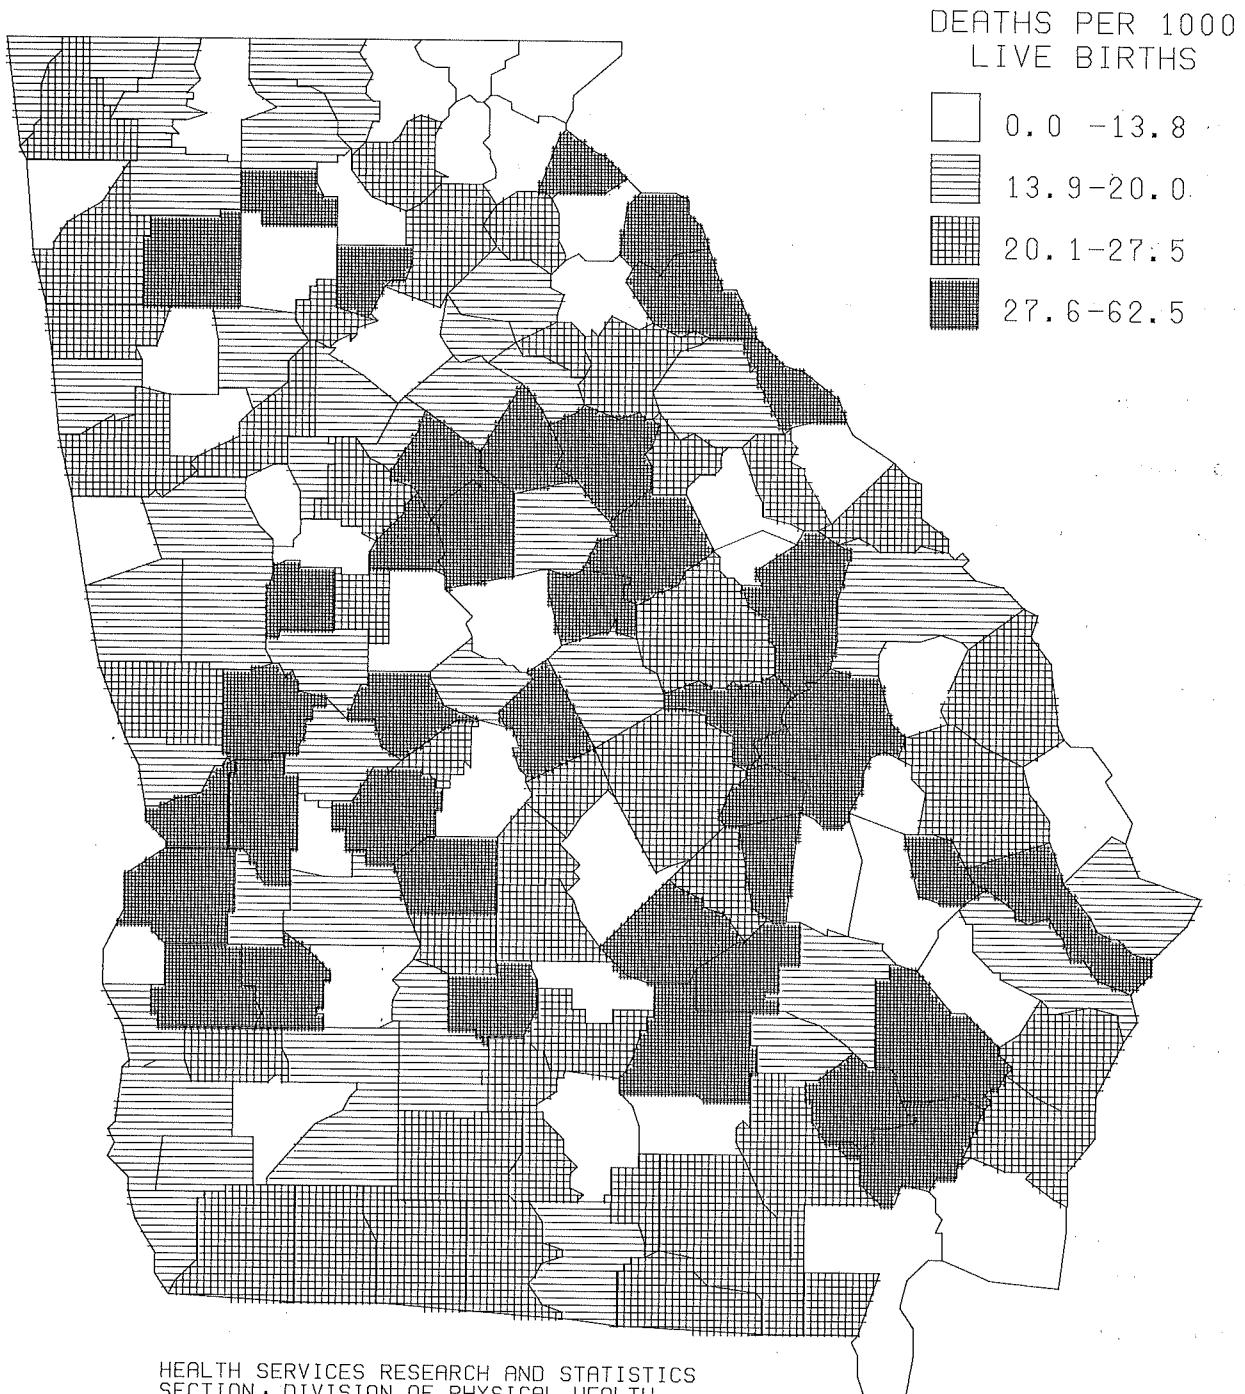

The county-by-county variation for 1973 reflects rates of 0.0 to 62.5 deaths per 1,000 live births for infants, and 0.0 to 44.1 for neonatal events (Figures 25 and 26).

When analyzing the geographic patterns of events that are subject to random variation, one must be careful in the interpretation and the subsequent conclusions. It is best to aggregate these events either temporally or geographically for more conclusive evidence of trends. However, the individual years do provide an overview.

The seasonal trend of infant deaths shows a peak in January and October (Figure 27). This closely corresponds to the traditional epidemiological year, except we see a major decline in the months of November and December.

There were 1,634 infant deaths in Georgia in 1973 (Table 8). Of these, 1,097 occurred in the first 28 days, and 600 of these occurred during the first day of life. Thus, 67% of the deaths occurred in the first 28 days of life, while approximately 36% occurred in the first day of life. The rates show substantial differences for the white and the black populations. The

*THE BLACK POPULATION OF GEORGIA INCLUDES 0.93% OTHER RACES.

white infant mortality rate is 15.5, while the black rate is 26.1 (Table 8). Also, of interest is that the male infant mortality rate is higher than the female for both population groups.

Maternal deaths, amounting to 17 for the state in 1973, were divided between the white and the black population with 5 and 12, respectively (Table 9). Five of the maternal deaths had listed as the cause of death pulmonary embolism. The total maternal death rate for 1973 is 2.0. However, the black rate of 4.1 is considerably higher than the white rate of 0.9 (Table 3, Section III).

SUMMARY

The evaluation of these three events plays an important role in the delivery of health programs for the medically indigent, high-risk mothers and their newborn. Therefore, it behooves program planners to analyze trends related to these events in order that quantifiable and realistic objectives may be stated.

MORTALITY

SECTION VI

MORTALITY

In this section, we will analyze the major mortality patterns by age, sex, race, geographic area, month of occurrence, and 20-year ranking.

Patterns of mortality from all causes are geographically illustrated by Figure 28. Age, sex, and race patterns related to mortality are shown in Tables 10 and 11. The seasonal variation in death occurrences is concentrated in the winter months of November, December, January, and February (Figure 29). These three facets concerning mortality may provide pertinent information needed in identifying high-risk groups by age, sex, race, geographic area, and seasonal occurrences.

The leading cause of death for the past 20 years is exhibited in Tables 12 and 13, and also in Figure 30. Table 13 shows that the 20-year rank for diseases of the heart is Number 1, whereas cerebrovascular disease is Number 2, and cancer is Number 3. However, for 1973, this latter pattern is reversed. Over the past 20 years, we have seen reductions in stroke, all other accidents, influenza and pneumonia, and birth injuries. Major increases have occurred in such causes as diseases of the heart, cancer, motor vehicle accidents, diseases of the respiratory system, diseases of the arteries, homicides, and diabetes mellitus. It is interesting to note, however, that for the period from 1970 to 1973 we have seen other patterns ending. For example, automobile accidents decreased by 1.0%, and diabetes decreased by 1.8%; while stroke increased by 0.8%, and all other accidents

Note: These diseases are grouped according to the International Classification of Diseases. The Sixth Revision was in effect until 1958, the Seventh Revision was in effect from 1958 until 1968, the Eighth Revision has been in effect from 1968 to the present.

69

TABLE 13
LEADING CAUSES OF DEATH, TWENTY YEAR RANK AND PERCENT CHANGE IN MORTALITY RATES, GEORGIA, 1973

Rank In 1973	Cause of Death	20 Year Rank	% Change 1960-1970	% Change 1970-1973
1	Diseases of the Heart	1	+6.8	+0.9
2	Cancer	3	+17.0	+5.3
3	Cerebrovascular Disease	2	-12.1	+0.8
4	Motor Vehicle Accidents	7	+50.8	-1.0
5	All Other Accidents	5	-2.6	+2.7
6	Influenza and Pneumonia	4	-17.5	-9.3
7	Diseases of the Respiratory System	9	+38.5	+20.0
8	Diseases of the Arteries, Veins, and Capillaries	8	+7.6	+3.5
9	Homicides	10	+67.0	+12.6
10	Birth Injuries and Other Diseases Peculiar to Early Infancy	6	-46.7	-30.5
11	Diabetes Mellitus	10	+32.3	-1.8

increased 2.7%. Figure 30 clearly delineates the trends of the top ten diseases in the state for the past 20 years.

Specific heart disease mortality rates for age and sex are portrayed in Table 14. The geographical distribution for death rates due to diseases of the heart shows a somewhat clustered concentration in the southern half of the state (Figure 31). The rates range from 138.9 to 680.4 per 100,000 population. This is substantial variability. These rates include hypertensive heart disease, ischemic heart disease, acute rheumatic fever heart disease, and all other forms of heart disease. Further, Table 14 shows concentrations in the male at ages 65-74. For ischemic heart disease, the male dominance is found in the 55-64 age group.

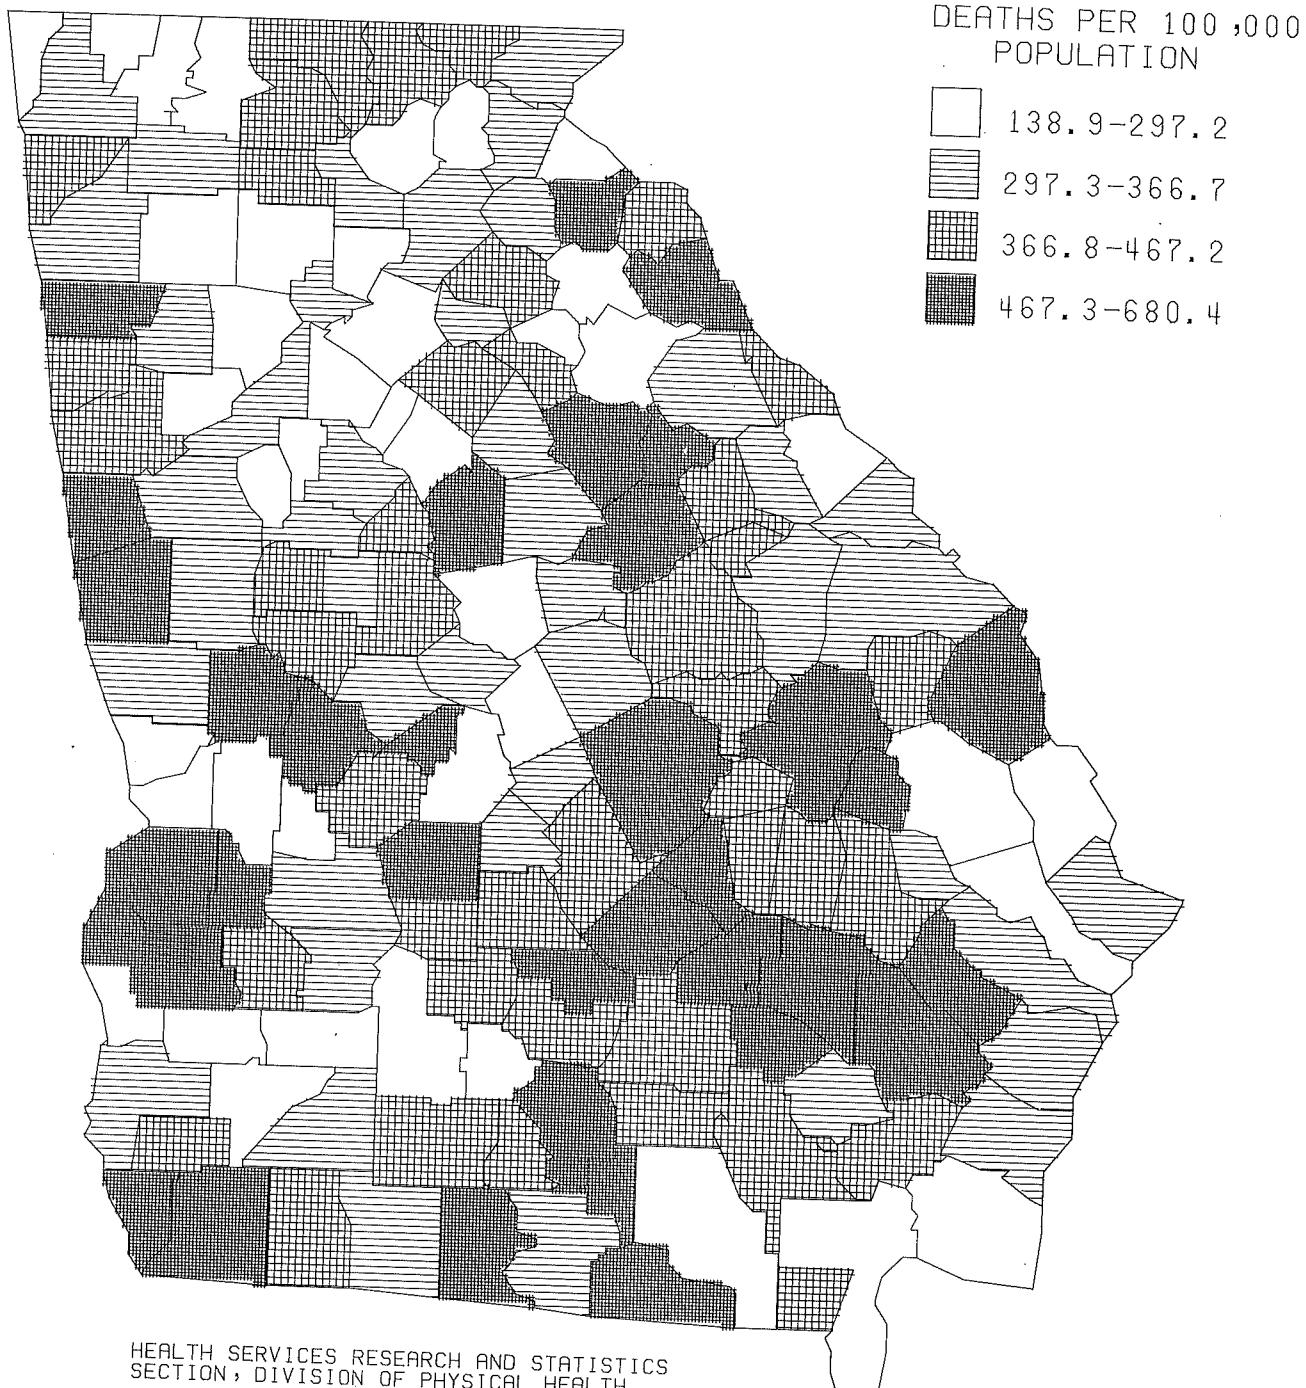

Cerebrovascular disease mortality is illustrated geographically by Figure 32. There are two definite clusters in the state for 1973. They are located in the southwestern and the south central areas. Another small county cluster appears in the southeastern portion of the state. The rates for this disease range from 19.9 to 549.1 per 100,000 population for 1973.

Figure 33 demonstrates death rates for all types of cancer for 1973. The rates range from 0.0 to 335.1. Although clusters do appear, the pattern cannot be clearly delineated. There were 6,532 deaths due to cancer in 1973. Of these, 3,667 occurred to males and 2,865 to females. The most common cancer is that of the lung, accounting for 1,466 deaths. Males accounted for 1,207 of these deaths. The dominate cause of cancer deaths for females are: colon and rectum, breast, genital, and uterine.

ACCIDENTAL DEATHS, 1973

DEATHS PER 100,000
POPULATION

HEALTH SERVICES RESEARCH AND STATISTICS
SECTION, DIVISION OF PHYSICAL HEALTH

There were 3,504 accidental deaths in Georgia in 1973 (Table 16). Motor vehicle accidents accounted for 52% of all accidental deaths. Accidental falls, the second most common death from accidents, accounted for 9.5%. The geographical distribution of accidental deaths is primarily rural, with county clusters adjacent to metropolitan areas. The rates range from 26.8 to 273.9 for 1973 (Figure 34). The highest rate for automobile accidents is concentrated in the 15-24 age group: 57.7 per 100,000 population. Deaths due to accidental falls are concentrated in the over 65 age group; the rate is 48.8 (Table 16). The under one age group has concentrations of death occurring via inhalation and ingestion of food and accidental mechanical suffocation; the respective rates are 29.9 and 25.1 for 1973.

SUMMARY

This section has shown considerable decomposition of mortality by age, sex, race, geographic area, rank, and trends. We hope this will give the health planner an overview of health status relative to mortality which he might use as a measure for his area to establish a benchmark of information.

MARRIAGES AND DIVORCES

SECTION VII

MARRIAGES AND DIVORCES

Social organizations have had profound impact on us as individuals. In particular, the institution of marriage appears to be taking on new forms--contract, trial, weekend, and homosexual marriages. The effects of each change are being reflected in the divorce patterns.

Typically, June is the bride's month (Table 19, Figure 35). There were 70,373 marriages in Georgia in 1973, and 12.3% of these occurred in June. This pattern is evident in both population groups. The age at marriage for both the bride and groom is concentrated in the 20-24 age group. This conclusion is valid for the white and black population (Table 17).

The general pattern of divorce has peaks in August and October (Figure 36). However, of equal concern is the low divorce period: December, January, and February. The primary reasons for divorce are given in Table 20. Cruel treatment accounts for 74.2% of the total divorces, while desertion represents 5%. There were five annulments in Georgia during 1973.

The ages at which divorce occurs are different for the husband and wife. The majority of divorces occur in the 30-39 age group for males and the 20-24 age group for females (Table 21). Most divorces are obtained after 0-4 years of marriage; in 1973, 11,757 marriages ended in divorces during the first four years (Table 22). As the number of married years increases,

35-39 years	135	139	102	106	98
40 and over	135	109	104	101	94
Not stated	853	693	1,160	2,181	2,363

the number of divorces decreases. For instance, in 1973 there were only 135 divorces for the marriage duration of 40 years and over, while for the duration of 0-9 years of marriage there were 17,408 divorces. This trend is evident for the past five years. Marriages by race and divorces for each county is listed in Table 23.

SUMMARY

Evidently, marriage is becoming an event that is being subjected to new trends. The data in this section and that portrayed in Section III, Trends of Life Occurrences, have highlighted these features. Divorce has steadily increased in Georgia, which may partially reflect the ages at marriage, but also our social patterns have undergone considerable change. These two events allow us to analyze the family structure and to provide potential indicators for the degree of disorganization in our society.

SELECTED HEALTH STATISTICS BY GEOGRAPHICAL AREA

SECTION VIII

SELECTED HEALTH STATISTICS BY GEOGRAPHICAL AREAS

This section contains rates and numbers of selected statistical events for the state. Also included is the geographical disaggregation for Standard Metropolitan Statistical Areas, service areas, cities, and counties (Figure 37). We hope this further analysis by various geographical areas will be of assistance to state and local planners.

DEFINITIONS AND NOTES FOR THIS SECTION

*Rates and ratios: Live birth rates are per 1,000 projected population; deaths, all ages, and deaths by cause are per 100,000 projected population; maternal death ratios are per 10,000 live births; fetal death rates are per 1,000 live births; all other rates are per 1,000 live births.

The county totals will not add back to the state totals because military figures are included in state totals, but not in county totals.

Rates for city data cannot be computed because there are no figures on city population available except for census years.

**THE BLACK POPULATION OF GEORGIA INCLUDES 0.93% OTHER RACES.

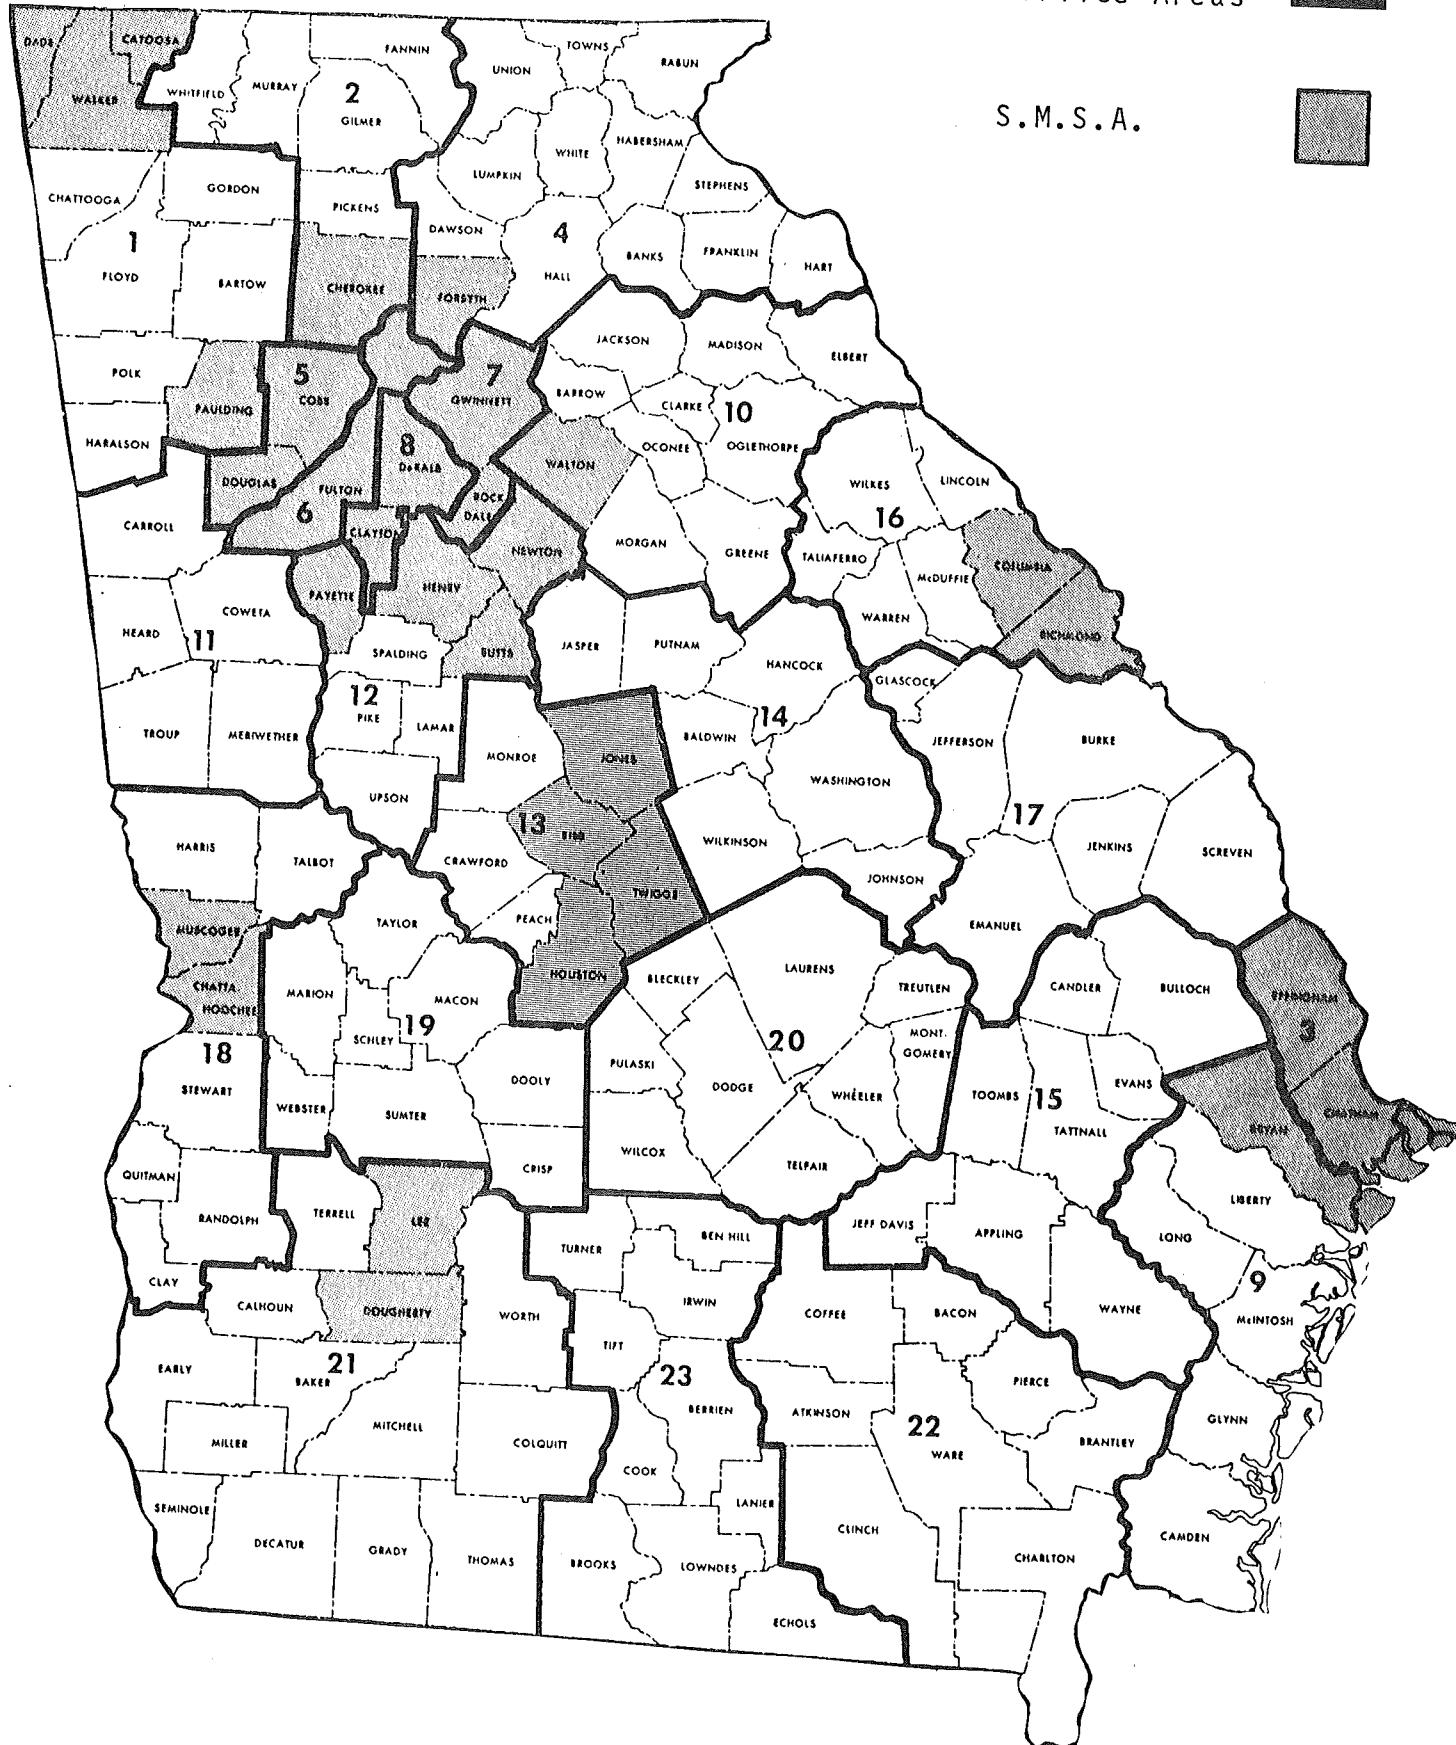

SYMBOLS USED IN THIS SECTION

- Quantity is zero in frequency table
