SECTION I

INTRODUCTION AND OVERVIEW

INTRODUCTION AND OVERVIEW

A barometer of the quality of life for Georgia residents may be partially found in the analysis of vital events. This volume presents specific events that relate to health and well-being in Georgia, including traditional indicators of birth, death, marriage, and divorce. In addition, a section on population trends and a section examining trends of life occurrences are also incorporated. Features of particular interest are the yearly trends demonstrated by the health data and the spatial patterns of selected events illustrated by computer mapping.

We believe this 1975 volume provides useful information for many phases of planning, especially health planning. It is our objective, therefore, to continuously improve this volume; we can only accomplish it by knowing the needs and feelings of those who use this information. We ask, therefore, for any comments that will help us to make future volumes more useful.

SOURCE AND COMPLETENESS OF DATA

Georgia law requires that certificates of vital events be submitted to the Vital Records Section, Division of Physical Health, Department of Human Resources. The Vital Records Section records and preserves the submitted documents. The Office of Health Services Research and Statistics (OHSRS), however, provides the tabulations, summaries,

analyses, and dissemination of the statistical information derived from the documents. The data presented in this volume were obtained primarily from the Vital Records' computer tapes. OHSRS prepared the population projections.

The validity of any information is dependent upon the accuracy and completeness of the reporting system. Problems such as unanswered portions of certificates and incorrect allocations of events to urban or rural residence have impacts on the quality of the information. Thus, "unknown" and erroneously answered items create a bias in the data which confounds scientific and experimental inquiry.

Table 1 amply demonstrates the need for continuous improvement in data reporting to assure increased quality of the birth record.

TABLE 1.--SELECTED BIRTH CATEGORIES SHOWING THE NUMBER AND PERCENT OF BLANKS FOUND ON RESIDENT BIRTH CERTIFICATES, GEORGIA, 1975

CATEGORY	NUMBER OF BLANKS IN CATEGORY	PERCENT OF TOTAL CERTIFICATES*
Total certificates with blanks	28,951	38.2
Infant's weight and weight code	2,927	3.9
Father's education	16,305	21.5
Mother's education	4,296	5.7
Complications related to pregnancy	9,564	12.6
Complications unrelated to pregnancy	8,666	11.4
Complications of labor	8,461	11.2
Method of delivery	8,060	10.6
Birth injuries or diseases of child	8,302	11.0
Congenital anomalies	8,261	10.9
Date last normal menses	6,442	8.5
Pregnancy month prenatal care began	8,483	11.2
Number of prenatal visits	12,779	16.9

*Total number of resident certificates sampled: 75,709.

The information displayed in Table 1 is available by county for those who would like to determine the accuracy of their county's data. Allocation of events by residence should be carefully reviewed if an individual is analyzing urban and rural differences; otherwise, this variation will present little difficulty in data analysis.

DEFINITIONS

This report utilizes many terms and technical connotations that must be defined to facilitate meaningful interpretation of the data. The list of terms and technical notes which follow should prove useful.

Terms

<i>BIRTH TO UNWED MOTHER:</i>	If the father's name does not appear on the birth certificate, then the event is statistically classified as a birth to an unwed mother. Many other states use the term "illegitimate birth."
<i>FETAL DEATH:</i>	A product of conception of any length gestation that shows no sign of life after complete birth. Prior to 1954, only fetal deaths of 20 or more weeks' gestation were recorded and classified as stillbirths.
<i>GRAVIDITY:</i>	Number of times previously pregnant, plus current pregnancy.
<i>IMMATURE BIRTH:</i>	A live birth with a weight of $5\frac{1}{2}$ pounds (2500 grams) or less. If weight is not specified, a live birth with length of gestation less than 37 weeks is considered immature.
<i>INFANT DEATH:</i>	A death occurring during the first year of life.
<i>LIVE BIRTH:</i>	One who shows any evidence of life (breathing, heartbeat, or movement of voluntary muscles) after complete birth.

LIVE BIRTH ORDER: The number of previous live births plus current birth.

MATERNAL DEATH: A death resulting from complications of pregnancy, childbirth, or puerperium.

NATURAL INCREASE: The excess of births over deaths while holding migration constant.

NEONATAL DEATH: A death occurring to an infant less than 28 days of age.

PARITY: Number of previous deliveries of longer than 20 weeks' gestation.

PERINATAL MORTALITY: Death of fetus or newborn infant occurring near the expected time of birth. Perinatal Period I: Fetal death of 28 or more weeks' gestation and infant death occurring the first seven days of life. Perinatal Period II: Fetal death of 20 or more weeks' gestation and infant death occurring in the first 28 days of life.

RACE: Tables and figures that include race classifications are tabulated by white and black categories only. The black category includes about 99% blacks and 1% other races.

RESIDENCE: Usual place of residence for that person by specific event. Mother's usual residence is utilized for birth and fetal death events.

TOTAL BIRTHS: Live births and fetal deaths.

TOTAL FERTILITY RATE: If the age-specific fertility rates for all ages are added and multiplied by the intervals into which the ages are grouped, the result is a total fertility rate. The resulting figure is an estimate of the number of children a cohort of 1,000 women would have if, during their reproductive years, they reproduced at the rates represented by the age-specific fertility rates from which the total fertility rate is computed.

Technical Notes

$$\text{AGE-SPECIFIC FERTILITY RATE} = \frac{\text{births specific to an age group}}{\text{females specific to an age group}} \times 1,000$$

$$\text{CRUDE BIRTH RATE} = \frac{\text{total live births}}{\text{total population}} \times 1,000$$

$$\text{CRUDE DEATH RATE} = \frac{\text{total deaths}}{\text{total population}} \times 1,000$$

$$\text{DIVORCE AND ANNULMENT RATE} = \frac{\text{total divorces and annulments}}{\text{total population}} \times 1,000$$

$$\text{FETAL DEATH RATE} = \frac{\text{total fetal deaths}}{\text{total live births}} \times 1,000$$

$$\text{GENERAL FERTILITY RATE} = \frac{\text{total live births}}{\text{total females, ages 15-44}} \times 1,000$$

$$\text{IMMATURE BIRTH RATE} = \frac{\text{total immature births}}{\text{total live births}} \times 1,000$$

$$\text{(a) IMMATURITY DEATH RATES} = \frac{\text{total deaths from immaturity}}{\text{total live births}} \times 1,000$$

$$\text{(b)} = \frac{\text{total deaths from immaturity}}{\text{immature live births}} \times 1,000$$

$$\text{INFANT DEATH RATE} = \frac{\text{deaths < 1 year of age}}{\text{total live births}} \times 1,000$$

LIVE BIRTH TO UNWED
MOTHER RATE

$$= \frac{\text{total live births to unwed mothers}}{\text{total live births}} \times 1,000$$

MARRIAGE RATE

$$= \frac{\text{total marriages}}{\text{total population}} \times 1,000$$

MATERNAL DEATH RATIO

$$= \frac{\text{total maternal deaths}}{\text{total live births}} \times 10,000$$

NEONATAL DEATH RATE

$$= \frac{\text{deaths < 28 days of age}}{\text{total live births}} \times 1,000$$

POSTNEONATAL DEATH RATE

$$= \frac{\text{total deaths from 28 days to 1 year}}{\text{total live births}} \times 1,000$$

TOTAL FERTILITY RATE

$$= 5 \left(\sum_{a=10-14}^{a=45-49} \text{age-specific fertility rate} \right)$$

EXAMPLE: BIRTH RATES BY AGE OF MOTHER, PER 1,000 WOMEN
IN THAT AGE GROUP, GEORGIA, 1975

Age	Rate
10-14	2.8
15-19	79.1
20-24	118.8
25-29	94.6
30-34	45.8
35-39	16.3
40-44	3.8
45-49	0.3

sum of age-specific
death rates per
1,000 women 361.5 x 5 = 1,807.5

If a hypothetical group of 1,000 women were to have the same birth rates in each age group observed in the actual childbearing population in 1975, they would have a total of 1,807.5 children by the time they had reached the end of the childbearing period (taken here as age 50), if all survived; or each woman would have an average of 1.8 children in her lifetime.

ADDITIONAL INFORMATION

The information found in the tables and figures in this volume is tabulated for Georgia residents by county of usual residence, except for the marriage and divorce data. Marriages are tabulated by county of application and divorces by county in which the decree was granted.

By no means is this published report exhaustive. The basic premise is to present information that is most often requested and most often needed by health planners. Additionally, many comparisons of data are made with national indicators. If further data are required, however, please contact:

- 0 Quantity is zero in rate table

SECTION II

PERSPECTIVE ON 1975

PERSPECTIVE ON 1975

A perspective should delineate the aspects of a subject so that the interrelationship of its components can be perceived. This section presents an overview and summary of significant trends in vital events and population changes for 1975 to provide a perspective for viewing Georgia in terms of the growth and change in health and health-related events.

A. Population Trends Since 1970

1. The population under one year of age decreased by 9.62%.
2. The age group 15-24 increased by 9.93%, and the age group 25-34 increased by 26.79%.
3. Representing 8.8% of the total population of Georgia, the population over age 65 increased by 18.27%.
4. By 1975, the median age of the total population had increased to 27.4, compared to 25.9 in 1970.

B. Birth Trends for 1975

1. *The birth rate was the lowest ever recorded in Georgia:* 16.2 live births per 1,000 population.
2. An average of 1.8 births occurred per woman of childbearing age in 1975. In the black population, there were 2.4

births per woman; for the white population, 1.6 births per woman.

3. The median age of a mother at the birth of her child was 23.0 years. For the white population, the median age was 23.7 years; for the black population, 21.6 years.
4. Live births to unwed mothers continued to increase, from 115.4 per 1,000 live births in 1970 to 145.8 per 1,000 live births in 1975.

C. Infant Mortality Trends

1. The infant death rate increased slightly in 1975, from 18.0 (infant deaths per 1,000 live births) in 1974 to 18.3 in 1975. In the black population, the rate was 25.2; in the white population, 14.5. The actual number of infant deaths, however, decreased from 1,505 in 1974 to 1,466 in 1975.
2. The largest single cause of infant deaths was anoxic and hypoxic conditions (ICDA 776), accounting for 27.1% of all infant deaths. The second major cause was congenital anomalies (ICDA 740-759), representing 15.3% of all infant deaths.
3. Infant deaths due to immaturity (per 1,000 immature births) decreased from 73.7 in 1954, 19.5 in 1974, to 13.8 in 1975.

4. Deaths occurring within the first 28 days of life accounted for 68.6% of all infant deaths. Deaths occurring within the first day of life accounted for 32.7%.

D. Mortality Trends

1. The total number of deaths decreased from 42,924 in 1974 to 41,314 in 1975, a 3.8% decrease. This represents the lowest number of deaths to residents since 1969.
2. In 1975, the death rate dropped to 8.0 deaths per 1,000 population--*the lowest death rate historically available.*
3. Deaths due to heart disease, stroke, motor vehicle accidents, all other accidents, and birth injuries continued to decline in the 1970-75 period.
4. Deaths due to cancer continued to increase.
5. Deaths due to diseases of the respiratory system and homicides decreased from 1974 to 1975.
6. Deaths due to influenza and pneumonia increased since 1974.
7. Suicides replaced deaths due to birth injuries and diseases peculiar to early infancy as the tenth leading cause of death.

E. Fetal Death Trends

1. Of the 23,556 fetal deaths occurring in 1975, 83.9% (19,769) were attributed to induced abortions.

2. Fetal deaths increased 15.2% since 1974.
3. Induced abortions increased by 13.7%, representing an average increase of six per day.
4. Spontaneous abortions increased 24.8%, an average increase of two per day.

F. Maternal Death Trends

1. Maternal deaths decreased by 29.6%.
2. Of the 19 maternal deaths occurring in 1975, five were due to ectopic pregnancy, and four were caused by toxemia.

G. Marriage Trends

1. The total number of marriages decreased from 66,656 in 1974 to 63,245 in 1975.
2. The greatest number of marriages per month occurred in June, amounting to 11% of all marriages.
3. The median age of all brides was 23.0; of all grooms, 25.8.
4. Of the 63,245 marriages performed, 43.6% of grooms and 43.5% of brides were previously married.
5. The marriage rate dropped to 12.8 per 1,000 population, the lowest rate since 1967.

H. Divorce Trends

1. Divorces increased by 9.3% since 1974, continuing the established trend. The divorce rate increased from 5.5

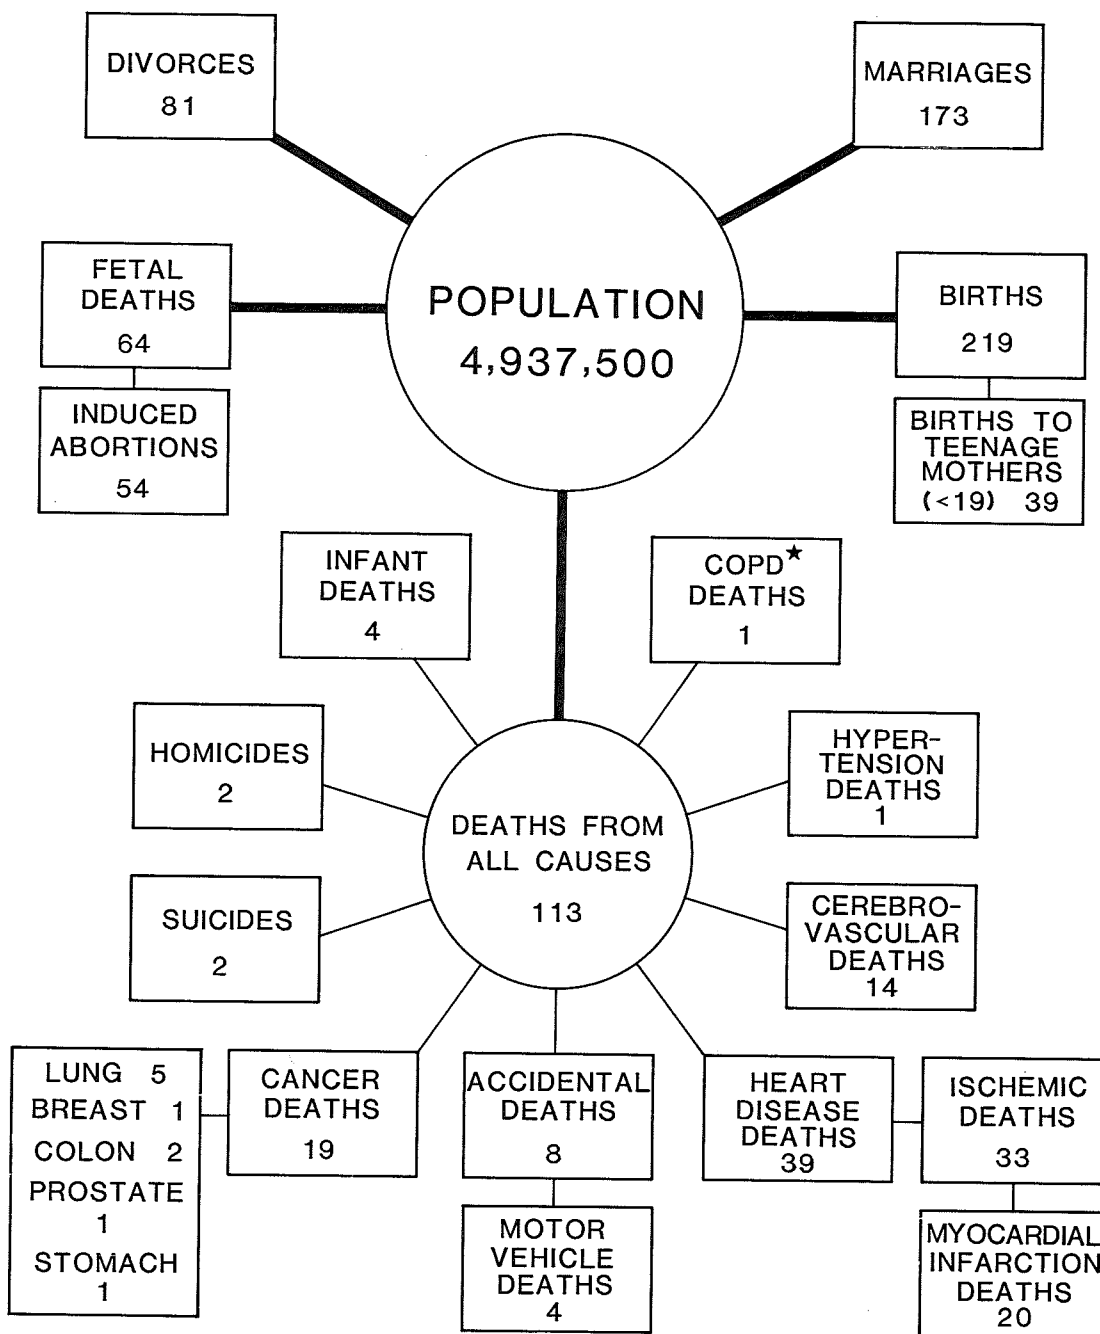

per 1,000 population in 1974 to 6.0 in 1975.

2. The leading grounds for divorce in 1975 were for marriages irretrievably broken (74%) and cruel treatment (21%). This represents a continuation of the extreme change experienced between 1973 and 1974, when marriages irretrievably broken increased from 9.8% (1973) to 56.6% (1974), and cruel treatment declined from 74.3% (1973) to 34.5% (1974). This trend reflects the increasing use of the 1973 law permitting divorce on grounds of mutual agreement.
3. The median age of the wife at the time of divorce was 27.4; for the husband, it was 29.5.
4. From 1974 to 1975, divorces increased an average of seven per day.

AVERAGE DAILY EVENTS IN GEORGIA, 1975

Figure 1 provides an overview of the vital events in Georgia occurring each day. Since 1974, numerical changes in several categories have occurred. Of particular significance is the decline in the daily average number of births: from 229 in 1974 to 219 in 1975. The total number of deaths per day also decreased from 118 in 1974 to 113 in 1975, representing a decrease in total number of deaths occurring in 1975 by 1,610--a 4% decrease from 1974.

 GEORGIA AVERAGED APPROXIMATELY :

*CHRONIC OBSTRUCTIVE PULMONARY DISEASE - INCLUDES ASTHMA,
 EMPHYSEMA, AND BRONCHITIS

FIGURE 1

SECTION III
POPULATION TRENDS

POPULATION TRENDS

Three major events govern population changes: births, deaths, and migration. The death rate tends to remain fairly constant over time, whereas the birth rate shows greater variability. Migration tends to be difficult to evaluate on a continuous basis.

The difference between the numbers of births and deaths is known as the rate of natural increase. As the death rate has remained constant over the past 20 years, the rate of natural increase reflects the birth rate. Figure 2 shows that the birth rate has been generally declining since 1949, except for a small increase in 1970. The implications of these facts are many. The children born in the "baby boom" after World War II have reached their late 20s and early 30s and have actually begun to move out of the major reproductive period. One would expect an increase in the number of births would have occurred as this group moved through the reproductive ages; but, in fact, the reverse happened. The actual number of births has declined since 1970, after a modest increase in the period 1967-70. Unless there is a major change in the age at which women give birth, it is likely that the birth rate will continue to decline. As a result, a large group of the population, now 25-34 years old (Figure 4), will move through successive age cohorts without a corresponding increase in the younger age groups (Figures 5-9).

Demands upon the health care system; Social Security; retirement, insurance, and benefits plans; and upon society in general will increase dramatically. As fewer numbers of young people are available to move into responsible positions in business and government, increasing demands will be made to retain the older age groups in their jobs beyond the normal retirement age of 65. It is possible that current Social Security and retirement programs will require an increasing percentage of the working person's income to support a greatly expanded elderly population. The health care system may see a tremendous increase in the number of people who are chronically ill, barring major advances against the leading killers--heart disease, stroke, and cancer. Ultimately, we may move away from today's youth-oriented culture toward a greater focus on the middle and later years of life. Even our definitions of "middle-age" and "elderly" may change. We must now begin to observe closely the changes occurring in the population and, as new trends become evident, adjust our programs and emphases to reflect the needs of society.

SECTION IV

TRENDS OF LIFE OCCURRENCES

TRENDS OF LIFE OCCURRENCES

As Georgia begins to focus on its New Health Outlook, it becomes increasingly important to examine the trends of life occurrences. Understanding the factors that influence these trends in terms of lifestyle, environment, human biology, and health care delivery may promote renewed interest in each and affect the ability to alter destructive trends leading to death and disability. By encouraging positive alterations in the factors influencing the trends of life occurrences, it may be possible to decrease still further certain trends with a history of decline and even reverse the upward trends of some major cripplers and killers. It is through observation of these trends that we will first be able to determine any impact we may have in improving the overall health status of Georgians. Thus, the trends become general indicators of the health status of the population.

As we examine the trends of life occurrences, we must consider several things:

1. The changes that we are undergoing as a society are reflected in declining marriage and birth rates and increasing divorce rates.
2. The impact of lifestyle and environment is evident in the leading causes of death. Many, if not most, of the cancers are closely linked to environment, whereas heart disease,

stroke, and accidents are closely tied to lifestyle.

3. Dramatic changes rarely occur in the trends of major life occurrences. Over a period of time, however, general trends, either upward or downward, are evident.
4. A sudden change in the overall trend should be viewed skeptically until data for succeeding years corroborates the change. For example, the drop in the 1975 death rate may not continue to decline in 1976 and beyond. In fact, as we observe death rates over time, little significant change is evident.
5. The ability to impact further upon many life occurrences may necessitate a reorientation of how we attack specific problems. For instance, infant mortality has declined dramatically from the early Twentieth Century, as has maternal mortality. But many of the leading causes of death have failed to decline. Even further reduction in infant mortality may require a reorientation of the traditional concepts of infant care, as the infants in extremely high risk account for a great percentage of infant deaths.

BIRTHS

Birth rates have shown a general decline since the 1940s, both white and black populations (Figure 12). The 1975 birth rate is the lowest rate recorded since statewide recording of vital events began in 1920.

Connected with births is the immaturity rate. After a sudden drop in 1974, this rate has returned more closely to the overall trend since the late 60s, showing a gradual decline (Figure 13). Although immaturity in whites has remained relatively constant over the past 20 years, immaturity in blacks increased substantially until 1969 but has generally declined up to 1975.

Deaths from immaturity have continued to decline from 1.5 in 1974 to 1.2 in 1975 (Table 3). Both the white and black populations have experienced similar declines.

FETAL DEATHS

Fetal deaths have increased dramatically since 1973, the year abortion laws were liberalized in Georgia. An additional impact on this trend is that, prior to 1954, only fetal deaths of greater than 20 weeks' gestation were recorded. If we divide fetal deaths, however, into its two components--induced abortions and spontaneous abortions--we find that 83.9% are induced. Both induced and spontaneous abortions have increased since 1974.

INFANT AND MATERNAL DEATHS

Infant, neonatal, and maternal death rates have shown a continual decline in Georgia (Figures 15, 16, and 17). From 1974 to 1975, a slight increase occurred in the infant and neonatal death rate for blacks. Further declines in these rates are certainly to be desired, as Georgia still ranks above the United States' rate; even the U. S. rate is high in comparison with other developed nations. Future gains, however, may be possible as we begin to channel greater resources

FIGURE 13

FETAL DEATH RATES BY RACE : GEORGIA, 1950 TO 1975

FIGURE 14

to the high-risk mothers and infants.

MORTALITY

Mortality has been fairly constant over the past 20 years, with no overall trend of decrease or increase (Figure 18). The black mortality rate has decreased from 10.4 in 1955 to 9.6 in 1975, and the white mortality rate has increased slightly from 7.3 in 1955 to 8.0 in 1975. A drop in mortality occurred for both population groups between 1974 and 1975 (Table 3).

MARRIAGE AND DIVORCE

Marriage and divorce rates provide some indication of the changes in social structures occurring in society (Figures 19 and 20). Marriage rates show great variability over time, alternately increasing and decreasing. The downward trend begun in 1973 has continued into 1975. Divorce rates have continued to increase at the same rate over the past ten years. In 1975, there were two divorces for every five marriages in the state.

SUMMARY

As society undergoes changes, the trends of life occurrences will reflect these changes. Birth rates, marriage and divorce rates, and fetal deaths from induced abortions provide indicators of changes occurring in lifestyles. The various mortality rates may provide indications of both changes in lifestyle and the effects that health promotion programs may be having. Through a critical analysis of these trends, we can determine where we have been and where we should be going in the attempt to improve the health status of Georgia's population. Needs are evident when health-threatening occurrences are not declining; on the other hand, potential benefits may be accruing from various programs when these rates are declining. Through careful analysis of these trends, it will be possible to allocate resources to areas having the greatest potential for change.

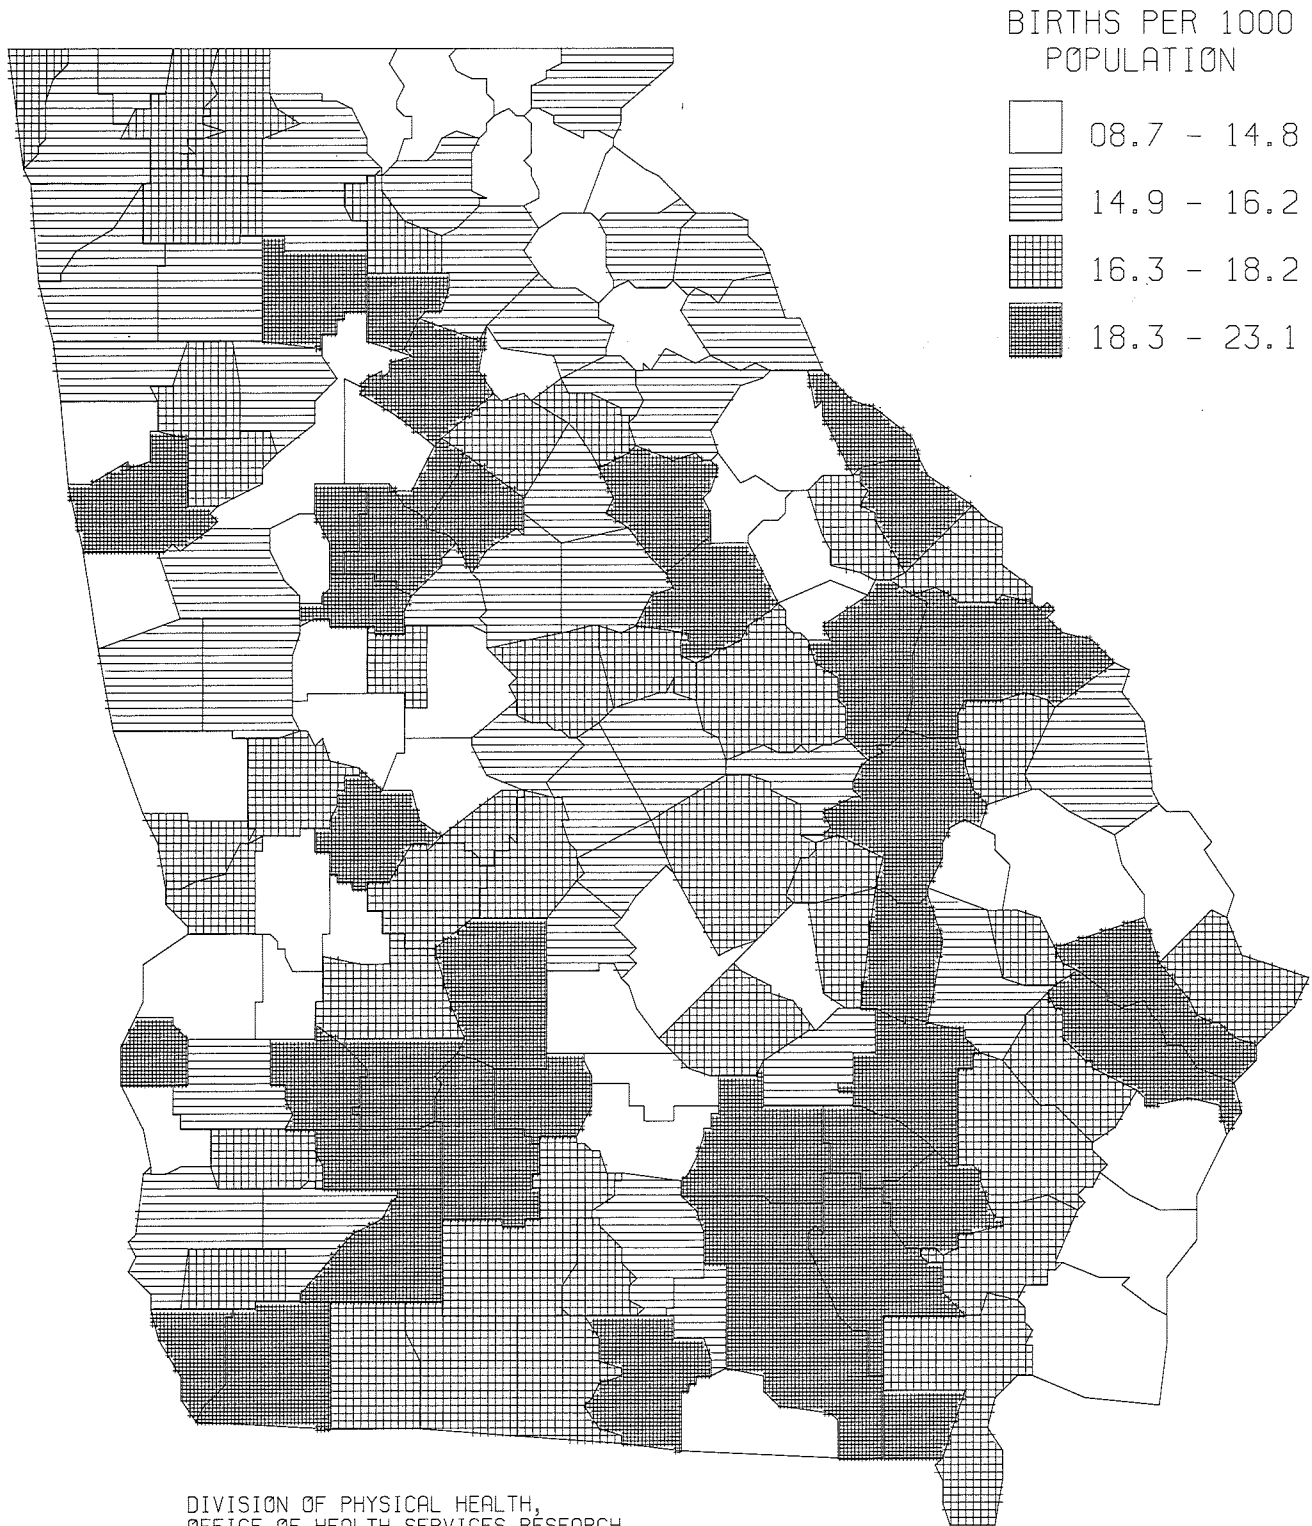

In the sections that follow, each of the life occurrences are presented in a variety of tabular and graphic forms, including maps of the spatial distribution among Georgia's counties. These tables and graphs provide valuable input for health planners and decision-makers in terms of identifying need groups and allocating resources to these groups.

SECTION V
BIRTHS

LIVE BIRTHS

This section presents resident live births, fetal deaths, and induced abortions in spatial and tabular forms. The live birth tabulations contain mother's age, parity, and age-specific birth rates. The fetal death data are separated into two areas: induced and spontaneous abortions and stillbirths. Included are maps for the two different data areas and tables by length of gestation and mother's age.

SECTION VI

INFANT AND MATERNAL MORTALITY

INFANT AND MATERNAL MORTALITY

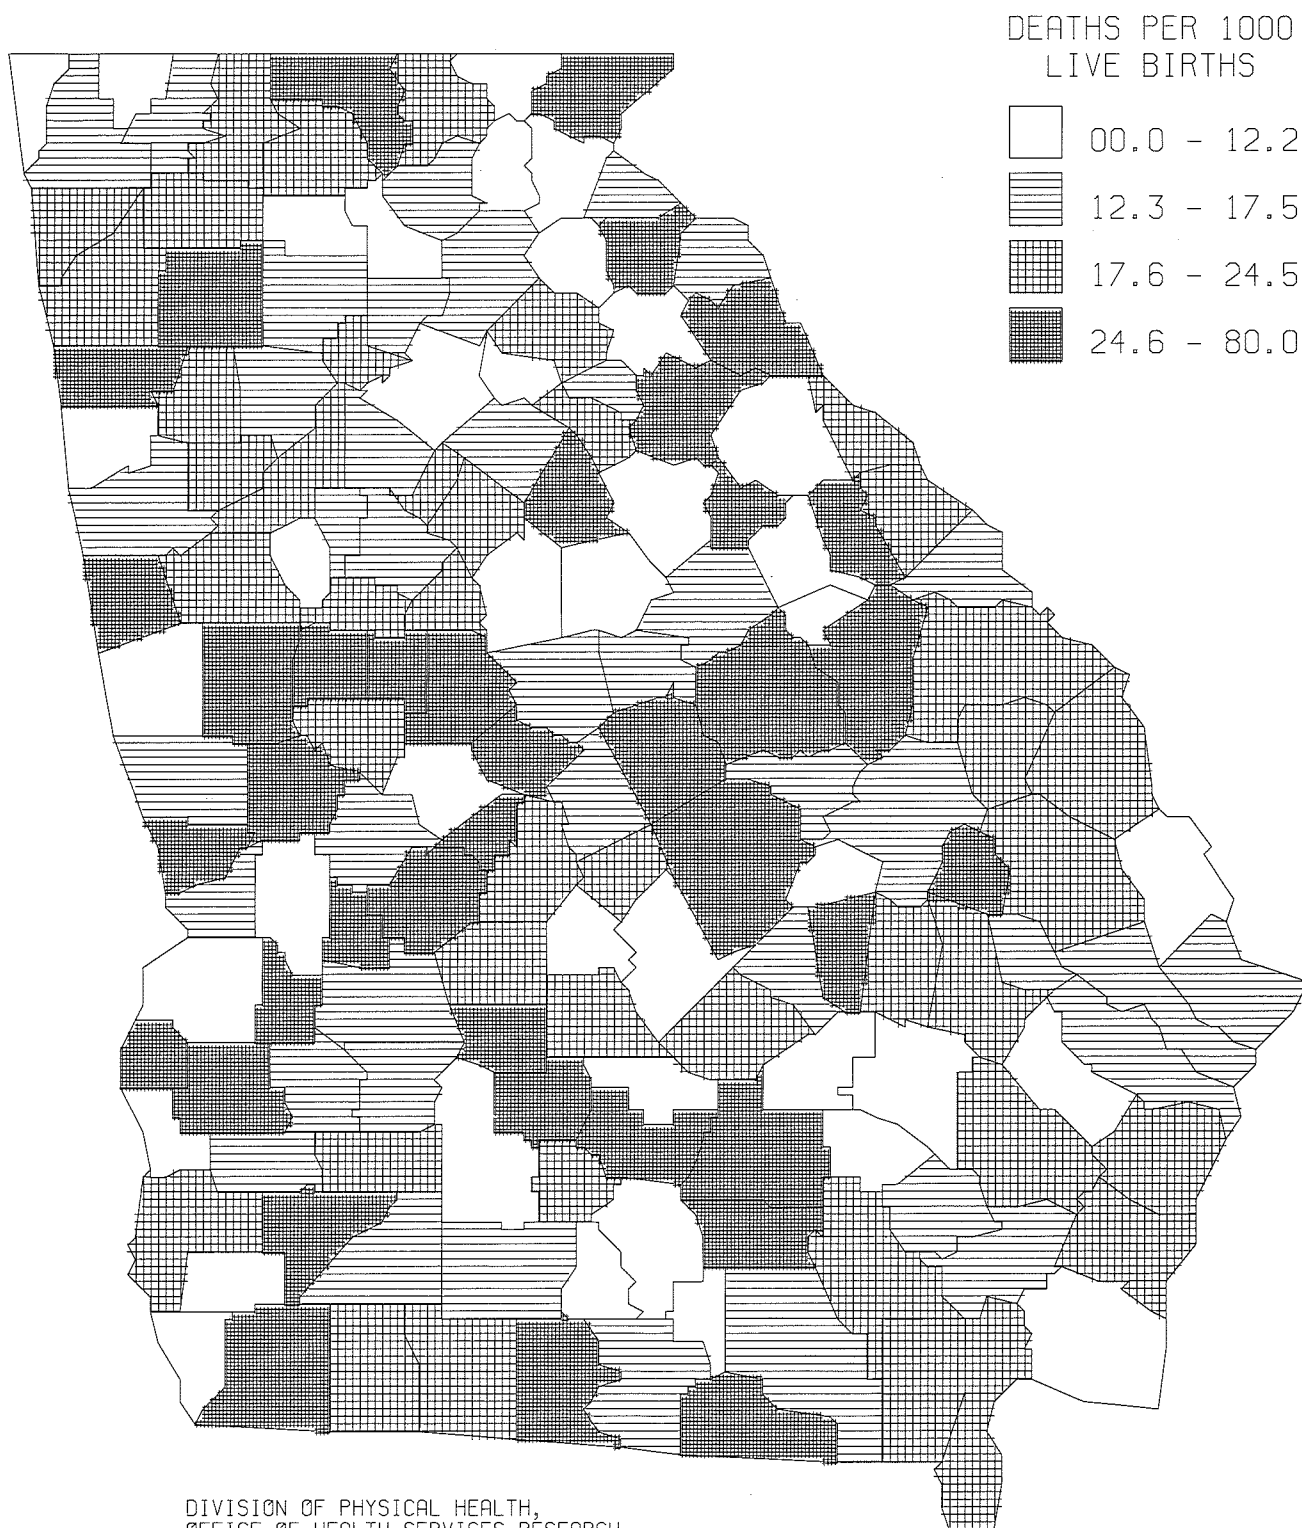

Maternal and infant mortality are briefly addressed in this section. The information is displayed in both graphic and tabular form. The tables on infant deaths include the subdivision of ages needed for comparison with the fetal death figures in computing perinatal mortality.

**TABLE 9 MATERNAL DEATHS, NUMBER AND RATIO PER
10,000 LIVE BIRTHS, BY RACE, GEORGIA, 1975**

SECTION VII
MORTALITY

MORTALITY

This section depicts in graphic and tabular form deaths occurring to Georgia residents in 1975. Some of the major causes of death are spotlighted for a more detailed analysis. The leading causes of death are listed for 1975 and for the preceding 20-year period.

DEATHS FROM ALL CAUSES BY RACE AND MONTH OF OCCURRENCE, GEORGIA, 1975
(EXCLUDING FETAL DEATHS)

SECTION VIII
MARRIAGES AND DIVORCES

MARRIAGES AND DIVORCES

In this section, state and county tabulations show number of marriages performed and divorces granted in Georgia in 1975. Because of the incompleteness of data filled in on certificates, it is not possible to make as detailed a breakdown of information for divorces as for marriages.

TABLE 20 MARRIAGES AND DIVORCES BY MONTH OF OCCURRENCE, GEORGIA, 1975

Month of Occurrence	Marriages				Divorces		
	Total	White	Black*	Unknown	Total	Divorces	Annulments
TOTAL	63,245	50,907	12,295	43	29,478	29,416	62
January	4,054	3,161	886	7	2,293	2,292	1
February	4,226	3,377	848	1	2,102	2,097	5
March	5,049	4,099	948	2	2,181	2,179	2
April	4,611	3,740	871	-	2,513	2,511	2
May	5,228	4,249	973	6	2,621	2,614	7
June	7,307	5,979	1,324	4	2,558	2,550	8
July	5,258	4,134	1,124	-	2,457	2,451	6
August	6,783	5,509	1,272	2	2,691	2,684	7
September	4,796	3,872	919	5	2,618	2,605	13
October	4,760	3,868	885	7	2,801	2,796	5
November	5,211	4,253	956	2	2,262	2,256	6
December	5,962	4,666	1,289	7	2,381	2,381	-

*The black population of Georgia includes 0.93% other races.

SECTION IX

SELECTED HEALTH STATISTICS
BY GEOGRAPHICAL AREA

SELECTED HEALTH STATISTICS BY GEOGRAPHICAL AREAS

This section contains rates and numbers of selected statistical events for Georgia. Also included are the geographical disaggregations for counties, standard metropolitan statistical areas, and health districts and units.

Figure 35, a county outline map, depicts the boundaries of the 19 health district-units used by the Division of Physical Health. Also shown are the ten 'Human Resources' districts and the current seven standard metropolitan statistical areas.

DEFINITIONS AND NOTES FOR THIS SECTION

The asterisks (*) in the table headings related to:

1. Rate or Ratio*: Live birth rates are per 1,000 projected population. Deaths, all ages, and deaths by cause are per 100,000 projected population. Maternal death ratios are per 10,000 live births. Fetal death rates are per 1,000 live births. All other rates are per 1,000 live births.
2. Black**: The black population of Georgia includes 0.93% other races.

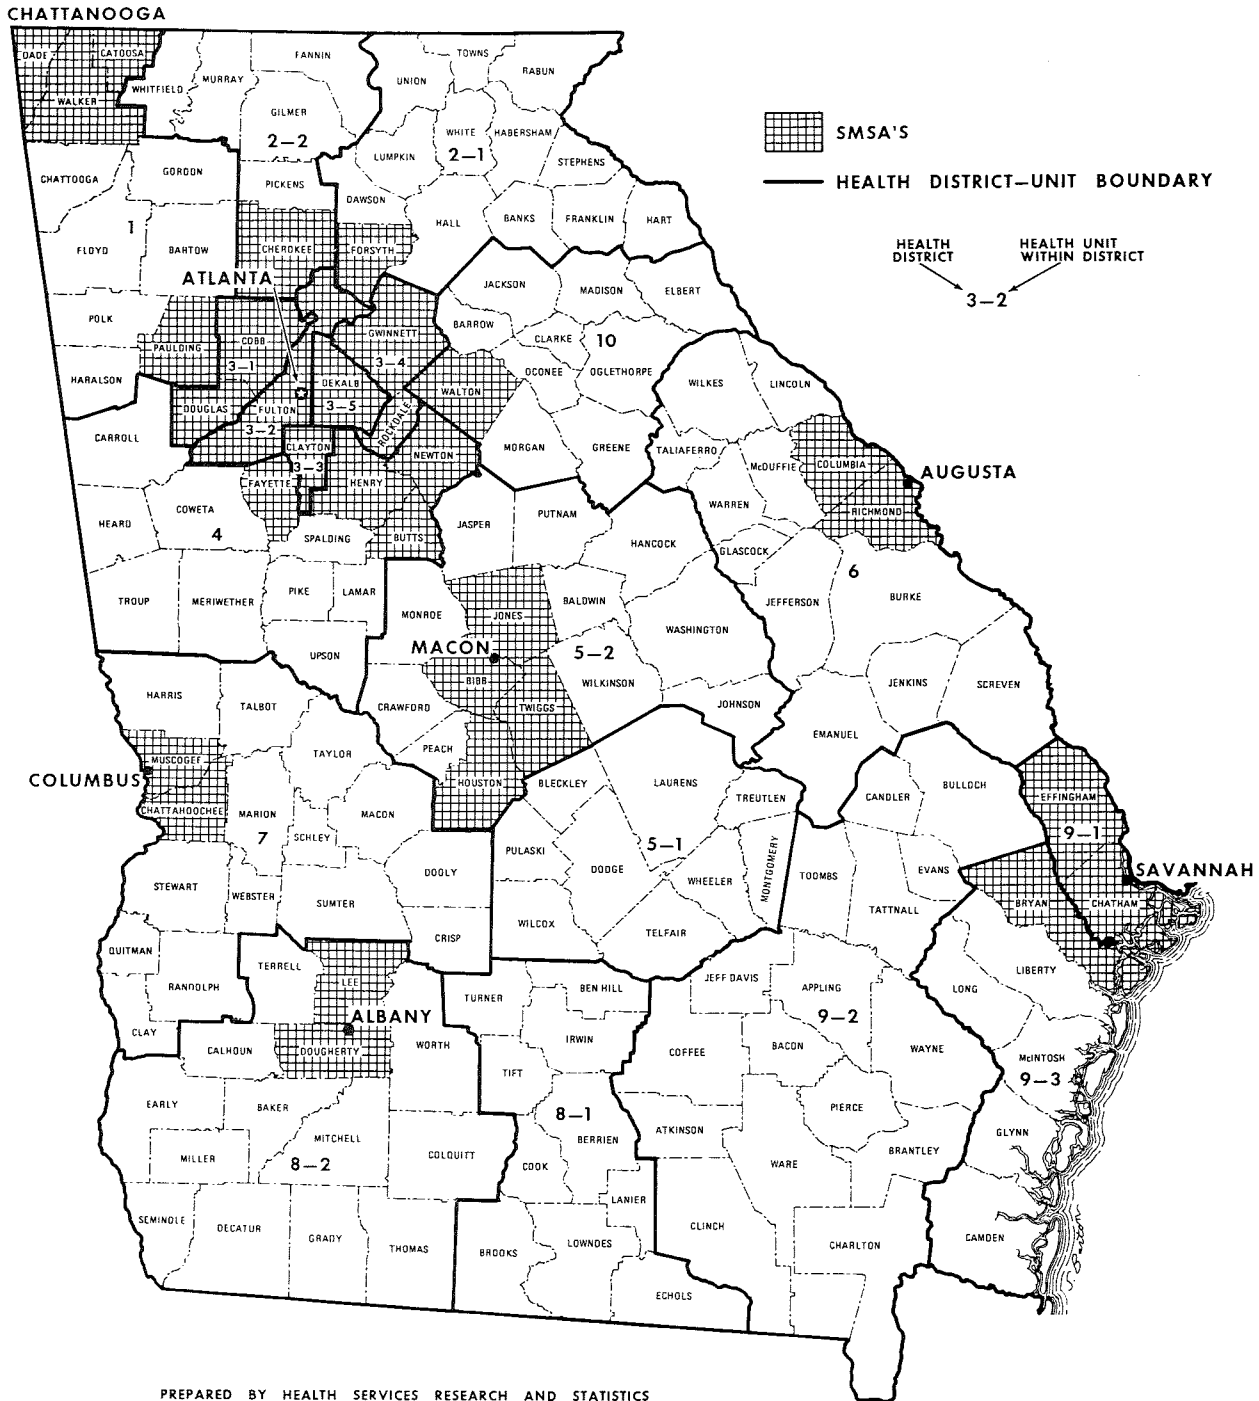

The county totals will not add back to the state totals because military figures are included in state totals but not in county totals.

Rates for city data cannot be computed because no figures on city population are available except for census years.

SYMBOLS USED IN THIS SECTION

- Quantity is zero in frequency table
- Data not available
- ... Rate or percent not applicable
- 0.0 Rate or percent more than zero but less than 0.05
- 0 Quantity is zero in rate table
