## INTRODUCTION

This volume is the 40th annual **Vital Statistics Report** of the State of Georgia. Its purpose is to serve as a reference source to provide useful information to public and private individuals, institutions, and agencies involved with the many phases of planning, especially the planning and evaluation of public health services for Georgia citizens.

The tables in this volume reflect annual frequencies and rates of vital events for the state's residents by: health district, metropolitan statistical area, and county.

The Office of Planning and Budget's civilian, noninstitutional population projections used in this volume, were adjusted by adding a resident residual component plus resident military. These projections are included to allow the reader to compute rates not represented in this volume. The reader must note, however, that there have been substantial changes in some county populations. In 1986, OPB re-calculated population estimates through 1990. The rates shown in this volume, therefore, may vary slightly from previous publications when trends are examined.

Please refer to the section on **Technical Notes** for definitions and formulas used in this report. Other vital statistics data not presented are available upon request but may require a fee to produce. Send statistical requests to:

We hope the information provided will prove helpful to users of this document. Comments or suggestions regarding this publication are welcomed.

This report includes 1986 Georgia resident data taken from certificates or reports of birth, death, marriage, divorce, spontaneous abortion or stillbirth, and induced abortion which were received in the State Vital Records office by June 30, 1987. The figures and rates reflect data from vital events occurring to residents of Georgia, including resident military, and to Georgia residents in other states or countries.

Please note, frequencies for blacks and whites in some tables may not equal to the total figure shown. The difference is accounted for by "other races"; however, all races are included in the total category.

The aggregation of infant mortality frequencies and rates is determined by the mother's indicated residence, as shown on the matching Certificate of Live Birth. Infant deaths occurring to resident military personnel are included.

The coded residence of infant deaths is adjusted in the following manner:

<u>BIRTH CERTIFICATE</u>	<u>DEATH CERTIFICATE</u>	<u>DEATH CERTIFICATE CODE ADJUSTMENT</u>
Georgia	Georgia	Mother's Residence on Birth Certificate
Georgia	Not Georgia	Mother's Residence on Birth Certificate
Not Georgia	Georgia	State of Residence as shown on Death Certificate

**TECHNICAL NOTES**

This section provides the reader with definitions and formulas of the rates used in this volume. Note that some of these rates may not agree with rates used in previous publications from this office, from other states, or from national statistics.

When comparing statistics, it is essential to determine whether or not the basis for computing rates is the same. For example, birth rates are often reported as either **crude** or **fertility** rates. The calculation of a **crude rate** is based on total population, whereas the calculation of a **fertility rate** is based on the female population of childbearing age. Total birth rates in this publication are per 1,000 females, ages 15-44.

The definitions and formulas in this section are arranged in the order of their appearance in the main text. Marriage and divorce figures are not included in the city section.

The selected state trends show mortality and natality rates for several observed years plus estimates for 1987 to 1990. Please note that estimated values are based upon past observations. The estimates should be used primarily as an indicator of the trend of the measured rate. Statistical variance, intervention programs, or unforeseen events may vary the actual values which will be observed for 1987 to 1990.

The observed rates are taken from the 1986 planning data set which incorporates revised population denominators supplied by OPB. The estimated values were determined by using trend line analysis, a form of linear regression. No attempt was made to determine that "best fit" regression model.
