INTRODUCTION

This report is prepared annually by the Central Statistical Unit to show more detailed tabulations of vital events recorded during the year with the Division of Vital Statistics of the Georgia Department of Public Health. Since 1947, the first year for which this report was made, the title has been Georgia Natality and Mortality Statistics, but since marriage and divorce statistics will be included in this and subsequent reports, the title has been changed to the more inclusive, Vital Statistics, Georgia.

These statistics are measures of the health status of the population and are used in planning certain phases of public health programs in the State.

All births, deaths, and stillbirths which were recorded with the Division of Vital Statistics as having occurred to residents of Georgia during 1951 are included in this report. The data on marriage and divorce were obtained in interviews of the county ordinaries and clerks of superior court by field men from the Division of Vital Statistics. Unless specified otherwise, all births, deaths, and stillbirths are allocated to place of residence; marriages are by place of issuance of license; and divorces, by place in which divorce was granted.

In May, 1951, the organization of counties into health regions was changed as shown on the preceding map to five regions. However, in this report for purposes of comparison with previous reports, all statistics by region are shown according to the former arrangement. County data not shown by region are arranged alphabetically by county for the state.

Most of the summary data will not be repeated in the same form in future reports, and since only a limited number of copies has been prepared, it is suggested that this copy be filed for future reference. Additional copies of most of the individual tables and more detailed tabulations of these and other public health statistics, are available upon request. Suggestions concerning content and arrangement of future reports will be welcomed. Address correspondence to:

DEFINITIONS OF TERMS AND EXPLANATION OF SOME FACTORS AFFECTING
THE ACCURACY OF STATISTICS IN THIS REPORT

A LIVE BIRTH is the birth of a child who shows evidence of life after the child is entirely outside the mother.

A STILLBIRTH is a birth after twenty weeks of gestation which is not a live birth.

An IMMATURE (Premature) BIRTH is the birth of a liveborn infant with a birth weight of $5\frac{1}{2}$ pounds (2500 grams) or less, or one specified as immature. If weight is not specified, a liveborn infant with a period of gestation less than 9 months (length of gestation is given in months on medical report of live birth) or specified as "premature" is considered immature.

A DEATH FROM IMMATURITY (Prematurity) is a death classified as "Immaturity" with mention of other subsidiary causes or "Immaturity Unqualified," International List numbers 774 and 776 respectively.

An INFANT DEATH is any death occurring during the first year of life.

A MATERNAL DEATH is a death from complication(s) of pregnancy, childbirth or the puerperium (International List numbers 640-652 and 670-689).

ILLEGITIMATE BIRTH - On the confidential medical report of birth this question is asked: "Is mother married to father of child?" Yes No. For statistical purposes, the answer "no" indicates an illegitimate birth.

A NEONATAL DEATH is any death under 28 days of age.

URBAN AND RURAL - All incorporated places in the state with 2500 or more persons in the 1950 Census, except North Atlanta, are classed as "urban." All other places are "rural."

NONWHITE, abbreviated NW, as used in this report, refers to that segment of the population consisting of Negroes, Indians, Japanese, Chinese, and other nonwhite races. Persons of Mexican birth or ancestry who are not definitely Indian or other nonwhite race, are classified as white. In 1940, 99.95% of the "nonwhite" population of Georgia was Negro. This percentage probably has not changed appreciably in the 1950 Census, so for most purposes, in Georgia, the terms "nonwhite" and Negro refer to essentially the same segment of the population.

INCOMPLETE REGISTRATION is one of the main sources of error in the registration of vital events in Georgia. The completeness of registration varies from county to county and in some instances accounts for differences in rates. Birth registration tests were made in 1940 and 1950, but no similar tests on the completeness of death registration are made. The following table shows the results of the birth registration tests for the State:

BIRTH REGISTRATION COMPLETENESS IN 1950 AND PERCENTAGE
INCREASE SINCE 1940 BY RACE: GEORGIA
(Births occurring in Georgia)

	Total	White	Nonwhite
1950 (Preliminary)	94.4	96.7	90.8
1940 (Final)	81.3	83.6	77.6
Percentage Increase	16.1	15.7	17.0

SOURCE: Federal Security Agency - Public Health Service -
National Office of Vital Statistics.

None of the statistics in this report have been adjusted for incomplete registration.

CHANGES IN CLASSIFYING CAUSES OF DEATH

In some instances the changes in classification of causes of death under the sixth revision of the International List have affected the comparability of rates for specific causes. Some of the mortality rates since 1949 are not comparable with rates under the fifth and previous revisions of the International List. See Georgia 1950 Natality and Mortality Statistics for more discussion of this change.

RATES - Crude birth and death rates are based on the 1951 population estimates shown in Table XIII. Rates for natality statistics are per 1,000 live births, unless indicated otherwise.

Due to incompleteness of registration of vital events and enumeration of population, all vital statistics rates are, in effect, based on samples and therefore subject to sampling errors. Chance variation is always larger for rates based on smaller populations or samples. This, in addition to the fact that errors, changes, or differences introduce wide variations in rates based on small figures, should be considered in the interpretation of rates.

In this report, crude live birth and death rates for the years 1940-1946 are based on the 1940 Census Counts of Population. Since 1946 these rates, including 1950 rates, are based on the estimated mid-year population. The populations for the years 1947-1949 were probably underestimated to a certain extent. No adjustment of rates for "low" population estimates is attempted in this report.

MILITARY RESERVATIONS - From 1940 through 1949, vital events occurring in military reservations were shown separately from county figures. In the 1950 report, those events occurring in military reservations, if the reservation was listed as the usual residence, were included in the county in which the reservation was located. In this report, events occurring to residents of military reservations are included in State totals, but are not included in county or regional figures.

SUMMARY OF SELECTED VITAL STATISTICS, GEORGIA: 1951

Population: An estimate of the population of Georgia is made each year by race, by county, for use in computing rates by county. The estimate for 1951 indicates that Georgia's population increased by 107,000 persons from July 1, 1950, to July 1, 1951. About 48,000 of this increase is the estimated increase in military personnel present in the state, which leaves an estimated increase of 59,000 in the civilian population during this period.

The estimates for 1951 are shown in Table XIII. The method used involved natural increase and available data from the 1950 Census. A detailed explanation of the method used is available on request.

Live Births: The 95,161 livebirths for 1951 is the highest number ever recorded for one year. This is about 1% higher than the previous high of 94,311 recorded in 1947 and is 3.3% higher than the 92,099 recorded for 1950. The rate for 1951, 26.7 per 1,000 population, is essentially the same as the rate for 1950. The percent of livebirths occurring in hospitals increased to 73.2% in 1951, with increases for the white and nonwhite populations, both urban and rural. Although most of the absolute increase in livebirths was classified as urban, the rates for 1950 and 1951 do not give the correct picture of the change in birth rates for rural and urban, since the populations which were used to compute rural and urban rates were quite different in 1951 as compared to 1950. See Table XIII of this report. Some of the differences between rural and urban rates might be due to differences in completeness of registration.

Deaths: The number of recorded deaths for 1951 is the highest since 1941, but the rate, 8.6 per 1,000 population, is the lowest ever recorded in the State. The death rate is lowest (6.8 per 1,000 population) among the rural white population, and is highest (14.3 per 1,000 population) among the urban nonwhite population. Some of this difference in death rates could be due to incomplete reporting of deaths from rural areas. Thirty-eight percent (38%) of all recorded deaths in 1951 occurred in hospitals. Percentage wise, fewer deaths (20.4%) among the rural nonwhite population occurred in hospitals than in any other group, while 52.0% of the urban white group died in hospitals.

Table III shows important causes of death by age group for 1951. The leading causes of death are the same as in 1950, except that tuberculosis dropped from eighth to ninth place and immaturity moved up from ninth to eighth place.

The following table shows age specific death rates for 1951.

AGE SPECIFIC DEATH RATES, GEORGIA: 1951
 (Rates per 100,000 estimated mid-year population in age group)

<u>Age Group</u>	<u>Rate</u>
All Ages	865.0
Under 1 Year	3356.7
1-4 Years	171.6
5-14 Years	67.5
15-24 Years	161.7
25-44 Years	374.3
45-64 Years	1585.3
65 and Over	5429.4

Stillbirths (Fetal Deaths): The stillbirth rate for 1951, 22.0 per 1,000 livebirths, is practically the same as the rate for 1950. The rate for the rural population appears to be slightly higher than the rate for the urban population.

Maternal Deaths: The death rate from puerperal causes continues to drop. The 1951 rate, 15.0 per 10,000 livebirths, is the lowest ever recorded in Georgia. The lowest rate, 5.3 per 10,000 livebirths, is recorded for white urban population; the highest, 28.8 per 10,000 livebirths, which is almost 6 times as high as the white urban rate, is recorded for the nonwhite rural group. Note that maternal death rates are per 10,000 livebirths.

Table V shows causes of maternal deaths.

Infant Deaths (Deaths under 1 year): The infant death rate, 34.2 per 1,000 livebirths for 1951, is slightly higher than the rates for 1949 and 1950. The urban rates are higher than the rural, but here again is the possibility that incomplete registration might account for the differences in the rates. Almost 55% of the recorded infant deaths occurred in hospitals.

Neonatal Deaths (Deaths under 28 days) account for about two-thirds of all infant deaths. There were 2,058 neonatal deaths recorded during 1951, and the rate per 1,000 livebirths was 21.6, approximately the same as the stillbirth rate. About one-half of the neonatal deaths occur during the first day of life.

Death from Immaturity: This is the leading cause of infant deaths. About 25% of all infant deaths were attributed to immature birth in 1951. See Tables II and X.

Immature Births: It appears that one out of every 13 babies born in Georgia during 1951 was immature. This is the fifth year for which statistics are available and the rate of 77.3 per 1,000 livebirths in 1951 is the highest on record. The 1951 rate is 27% higher than the rate for 1947, 60.8 per 1,000 livebirths; but there are several factors to be considered in interpreting these figures, such as differences in reporting by attendant, classification differences during the 5 years, etc. Actually, what appears to be an increase in immaturity may just be an indication of a better knowledge and awareness of the problem.

Illegitimate Births: The 1951 rate for illegitimate births, 87.5 per 1,000 livebirths, is the highest ever recorded in Georgia. The previous high was 84.0 per 1,000 livebirths recorded in 1933.

TABLE XIII - Continued

ESTIMATED POPULATION OF GEORGIA - July 1, 1951

AREA	TOTAL	WHITE	NONWHITE	AREA	TOTAL	WHITE	NONWHITE
Wilcox	9,900	6,500	3,400	Wilkinson	9,700	5,000	4,700
Wilkes	12,100	5,400	6,700	Worth	19,200	9,900	9,300
Washington	3,900	1,800	2,100	Sylvester	2,700	1,500	1,200

* Racial breakdown of cities lying in two counties not available by separate counties at the time of printing.

Population of state institutions is included in state total but is excluded from county figures.

A dash (-) indicates a population of less than fifty.

County totals may not add back to state totals due to rounding.
